I. Measures

1 MEASURE SPACES

- Lebesgue - improvement of Riemann integral in \mathbb{R}^d , translation-invariant measure on \mathbb{R}^d , L^p -spaces, rigorous treatments of convergence of functions
- Kolmogorov - theoretical foundations of probability

Philosophy

- rigorous notion of measure
- a theory of integration of appropriate functions
- the core of the theory provides a robust sequence of tools to approximate/calculate these rigorously
- Functional analysis (L^p spaces, duality, Lebesgue differentiation)

Definition. Let $X \neq \emptyset$ be a set. $\mathcal{M} \subset \mathcal{P}(X)$ is called a σ -**algebra** on X if

1. $X \in \mathcal{M}$
2. $A \in \mathcal{M} \Rightarrow A^c \in \mathcal{M}$
3. If $A_n \in \mathcal{M}$ for all $n \in \mathbb{N}$, then $\bigcup_{n \in \mathbb{N}} A_n \in \mathcal{M}$

The pair (X, \mathcal{M}) is called a **measurable space**. The elements of \mathcal{M} are called **measurable sets**.

Definition. Let (X, \mathcal{M}) be a measurable space, (Y, τ) be a topological space. Then $f : X \rightarrow Y$ is called **measurable** if $f^{-1}(V) \in \mathcal{M}$ for all $V \in \tau$.

We have the following properties of σ -algebras.

- 1.1 Proposition.**
1. $\emptyset \in \mathcal{M}$
 2. $A_1, A_2, \dots, A_n \in \mathcal{M} \Rightarrow A_1 \cup A_2 \cup \dots \cup A_n \in \mathcal{M}$
 3. $A_n \in \mathcal{M}$ for all $n \in \mathbb{N}$ then $\bigcap_{n=1}^{\infty} A_n \in \mathcal{M}$
 4. $A, B \in \mathcal{M} \Rightarrow A \setminus B \in \mathcal{M}$
 5. f is measurable, $H \subset Y$ is closed, then $f^{-1}(H) \in \mathcal{M}$.

PROOF 1. $X \in \mathcal{M} \Rightarrow X^c \in \mathcal{M}$.

2. We can extend this to a countable union by introduction $A_{n+i} = \emptyset$ for $i \in \mathbb{N}$.
3. By DeMorgan's identities, $(\bigcap A_n)^c = \bigcup A_n^c \in \mathcal{M}$.
4. $A \setminus B = A \cap B^c \in \mathcal{M}$.
5. H^c is open implies $f^{-1}(H^c) \in \mathcal{M}$. Then $f^{-1}(H) = (f^{-1}(H^c))^c \in \mathcal{M}$. ■

One can define the extended real line as follows: set the space $X = \mathbb{R} \cup \{-\infty, +\infty\}$. Then the topology is given by

$$G \in \tau \Leftrightarrow \begin{cases} \forall x \in G \cap \mathbb{R} & \exists r > 0 \text{ s.t. } (x-r, x+r) \subset G \\ -\infty \in G & \exists b \in \mathbb{R} \text{ s.t. } (-\infty, b) \subset G \\ +\infty \in G & \exists a \in \mathbb{R} \text{ s.t. } (a, \infty) \subset G \end{cases}$$

The same can be done with a single symbol as well. In either case, the extended real line is a compact set. We also extend the general operations so that $a + \infty = \infty$ for any $a \in (0, \infty]$, and $\infty = \sup[0, \infty] = \sup[0, \infty)$, and similarly for $-\infty$.

We define for $(a_i) \subset [0, \infty]$

$$\sum_{i=1}^{\infty} a_i = \sup_{n \in \mathbb{N}} \sum_{i=1}^n a_i$$

If $(a_i), (b_i) \subset [0, \infty]$, then

$$\sum_{i=1}^{\infty} (a_i + b_i) = \sum_{i=1}^{\infty} a_i + \sum_{i=1}^{\infty} b_i$$

Furthermore, if $(a_{ij})_{i=1}^{\infty}{}_{j=1}^{\infty} \subset [0, \infty]$, then

$$\sum_{i=1}^{\infty} \sum_{j=1}^{\infty} a_{ij} = \sum_{j=1}^{\infty} \sum_{i=1}^{\infty} a_{ij}$$

This is the image of positive measures:

Definition. Let (X, \mathcal{M}) be a measurable space. A function $\mu : \mathcal{M} \rightarrow [0, +\infty]$ is called a **(positive) measure** if it is countably additive and not constant $+\infty$. In other words,

1. $\mu(\emptyset) = 0$
2. $\mu\left(\bigcup_{n=1}^{\infty} A_n\right) = \sum_{n=1}^{\infty} \mu(A_n)$ if $A_i \cap A_j = \emptyset$

The pair (X, \mathcal{M}, μ) is called a **measure space**.

- 1.2 Proposition.**
1. If $A_i \cap A_j = \emptyset$ then $\mu\left(\sum_{i=1}^n A_i\right) = \sum_{i=1}^n \mu(A_i)$.
 2. $A \subset B$ implies $\mu(A) \leq \mu(B)$ Then $\mu(B \setminus A) = \mu(B) - \mu(A)$.
 3. If $A_1, A_2, \dots \in \mathcal{M}$, then $\mu\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i)$. This is referred to as σ -subadditivity.
 4. $A_1 \subset A_2 \subset A_3 \dots$ then $\lim_{n \rightarrow \infty} \mu(A_n) = \mu\left(\bigcup_{n=1}^{\infty} A_n\right)$
 5. $A_1 \supset A_2 \supset A_3 \dots$ and $\mu(A_i) < \infty$ then $\lim_{n \rightarrow \infty} \mu(A_n) = \mu\left(\bigcap_{n=1}^{\infty} A_n\right)$

PROOF 1. Obvious.

2. Follows since $B = A \cup (B \setminus A)$ is a disjoint union.

3. Let $E_1 = A_1$, $E_{n+1} = A_{n+1} \setminus \bigcup_{i=1}^n A_i$. Then $E_i \cap E_j = \emptyset$ and if $i \neq j$ and for all $i \in \mathbb{N}$, $E_i \in \mathcal{M}$ and $\bigcup_{i=1}^{\infty} E_i = \bigcup_{i=1}^{\infty} A_i$. Thus

$$\begin{aligned} \mu\left(\bigcup_{i=1}^{\infty} A_i\right) &= \mu\left(\bigcup_{i=1}^{\infty} E_i\right) \\ &= \sum_{i=1}^{\infty} \mu(E_i) \\ &\leq \sum_{i=1}^{\infty} \mu(A_i) \end{aligned}$$

4. Define $B_1 := A_1$ and $B_i = A_i \setminus A_{i-1}$ for $i \geq 2$. Then $B_i \cap B_j = \emptyset$ and $\mu(A_n) = \mu\left(\bigcup_{i=1}^n B_i\right) = \sum_{i=1}^n \mu(B_i)$. Similary, $\mu\left(\bigcup_{n=1}^{\infty} A_n\right) = \mu\left(\bigcup_{n=1}^{\infty} B_n\right) = \sum_{n=1}^{\infty} \mu(B_n)$. Therefore, $\lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(B_i) = \sum_{n=1}^{\infty} \mu(B_n)$.
5. Let $A_i = E_1$, $A_{n+1} = E_{n+1} \setminus \bigcup_{i=1}^n E_i$. Then, here $A_i \cap A_j = \emptyset$, $\bigcup_{i=1}^n A_i = E_n$ and $\bigcup_{i=1}^{\infty} A_i = \bigcup_{i=1}^{\infty} E_i$. Then

$$\begin{aligned} \mu\left(\bigcup_{i=1}^{\infty} A_i\right) &= \mu\left(\bigcup_{i=1}^{\infty} E_i\right) \\ &= \sum_{i=1}^{\infty} \mu(A_i) \\ &= \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i) \\ &= \lim_{n \rightarrow \infty} \mu\left(\bigcup_{i=1}^n A_i\right) \\ &= \lim_{n \rightarrow \infty} \mu(E_n) \end{aligned}$$

6. Let $C_n = A_1 \setminus A_n$, $C_1 = \emptyset$. Then $C_1 \subset C_2 \subset \dots$ and $\mu(C_n) + \mu(A_n) = \mu(A_1)$. Let $A = \bigcap_{n=1}^{\infty} A_n$ so $A_1 \setminus A = \bigcup_{n=1}^{\infty} C_n$ and $(\bigcup C_n) \cup A = A_1$ is a disjoint union. But then $\mu(\bigcup_{n=1}^{\infty} A_n) + \mu(A) = \mu(A_1)$ so that

$$\mu(A_1) - \mu(A) = \mu\left(\bigcup_{n=1}^{\infty} C_n\right) = \lim_{n \rightarrow \infty} \mu(C_n) = \mu(A_1) - \lim_{n \rightarrow \infty} \mu(A_n)$$

Since $\mu(A_1)$ is finite, we have $\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$. ■

TYPES OF MEASURES

Definition. A measure space (X, \mathcal{M}, μ) is called:

1. **finite** if $\mu(X) < \infty$
2. a **probability space** if $\mu(X) = 1$. If $0 < \mu(X) < \infty$, then $\frac{1}{\mu(X)}\mu$ is a probability measure.
3. **σ -finite** if there is a countable collection $\{X_i\}_{i=1}^{\infty} \subseteq \mathcal{M}$, $\bigcup_{i=1}^{\infty} X_i = X$, and $\mu(X_i) < \infty$.

4. **decomposable** if there is a set $\Pi \subseteq \mathcal{M}$ such that

- a) Π partitions X
- b) If $E \subseteq X$, then $E \in \mathcal{M}$ if and only if $E \cap P \in \mathcal{M}$ for each $P \in \Pi$
- c) $\mu(P) < \infty$ for all $P \in \Pi$
- d) If $E \in \mathcal{M}$ with $\mu(E) < \infty$, then

$$\mu(E) = \sup_{\mathcal{F} \subseteq \Pi \text{ finite}} \sum_{P \in \mathcal{F}} \mu(E \cap P) := \sum_{P \in \Pi} \mu(E \cap P)$$

5. **semifinite** if for any $E \in \mathcal{M}$ with $\mu(E) > 0$, there is $F \in \mathcal{M}$, $F \subseteq E$ such that $0 < \mu(F) < \infty$ (each set is “finitely approximatable from below”)

6. **complete** if whenever $N \subseteq X$ such that $N \subseteq E$, $E \in \mathcal{M}$ and $\mu(E) = 0$, then $N \in \mathcal{M}$.

A common technique that σ -finiteness allows is to define $E_n = \bigcup_{i=1}^n X_i$, so $E_1 \subseteq E_2 \subseteq \dots$, $X = \bigcup_{i=1}^{\infty} E_i$ and each $\mu(E_i) < \infty$. Alternatively, let $A_1 = X_1$, $A_{n+1} = X_{n+1} \setminus \bigcup_{i=1}^n X_i$, so each $A_i \in \mathcal{M}$, $A_i \cap A_j = \emptyset$ if $i \neq j$, each $\mu(A_i) < \infty$, and $X_i = \bigcup_{j=1}^{\infty} A_j$ disjointly.

1. probability \Rightarrow finite $\Rightarrow \sigma$ -finite \Rightarrow decomposable, semifinite
2. Completeness has some technical usefulness. However, every measure space (X, \mathcal{M}, μ) extends to a complete measure space, so this property is rather unexciting. Most “natural” constructions of measures give us complete measures.

EXAMPLES OF MEASURES

1. The zero measure. Given a measurable space (X, \mathcal{M}) , let $\mu(E) = 0$ for $E \in \mathcal{M}$.
2. Counting measure. Let X be any non-empty set. Then $\mathcal{P}(X)$ is a σ -algebra on X . We let $\gamma : \mathcal{P}(X) \rightarrow [0, \infty]$ by

$$\gamma(E) = \begin{cases} |E| & : |E| < \infty \\ \infty & : \text{otherwise} \end{cases}$$

Then $(X, \mathcal{P}(X), \gamma)$ is a measure space (easy exercise). This space is

- finite if and only if X is finite
- σ -finite if and only if X is countable
- always decomposable ($\Pi = \{\{x\} : x \in X\}$).
- always semifinite
- always complete

Since $X \neq \emptyset$, if X is finite, let $\nu = \frac{1}{|X|} \gamma$ is the uniform probability.

3. Point mass/Dirac. Let $a \in X$ and define $\delta_a : \mathcal{P}(X) \rightarrow \{0, 1\} \subset [0, \infty]$ by

$$\delta_a(E) = \begin{cases} 1 & : a \in E \\ 0 & : a \notin E \end{cases}$$

Again, this is clearly a measure. It is complete, since null sets are those which do not contain a . It is also a probability measure.

4. Let X be a countable set, and let \mathcal{M} be the subsets of X that are countable or have countable complement. Define $\mu : \mathcal{M} \rightarrow [0, \infty]$ by $\mu(E) = 0$ if E is countable, and infinity otherwise. The measure is not semifinite, nor decomposable, and naturally not σ -finite. However, it is complete.

5. Let $X = \{x_0\}$, the singleton sets. Then $\mathcal{P}(X) = \{\emptyset, \{x_0\}\}$, and define $\mu(\emptyset) = 0$ and $\mu(\{x_0\}) = \infty$. It is not decomposable, nor decomposable.

2 OUTER MEASURES AND CARATHEODORY'S THEOREM

Definition. Let X be a non-empty set. An **outer measure** on X is a function $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$ such that

- (i) $\mu^*(\emptyset) = 0$
- (ii) $A \subseteq B$ implies $\mu^*(A) \leq \mu^*(B)$
- (iii) $A_1, A_2, \dots \in \mathcal{P}(X)$, then

$$\mu^*\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \sum_{i=1}^{\infty} \mu^*(A_i)$$

Remark. (a) Any measure on $\mathcal{P}(X)$ is an outer measure

- (b) Advantage: outer measures are easy to construct and have largest domain
- (c) Disadvantage: may not have σ -additivity

2.1 Proposition. Let $\mathcal{E} \subseteq \mathcal{P}(X)$ be any family such that $\{\emptyset, X\} \subseteq \mathcal{E}$, and there is a function $\rho : \mathcal{E} \rightarrow [0, \infty]$ such that $\rho(\emptyset) = 0$. Then the formula, for $A \in \mathcal{P}(X)$,

$$\mu^*(A) = \inf \left\{ \sum_{i=1}^{\infty} \rho(E_i) : E_1, E_2, \dots \in \mathcal{E}, A \subseteq \bigcup_{i=1}^{\infty} E_i \right\}$$

defines an outer measure on X .

Note: Unless (\mathcal{E}, ρ) is “nice”, we may not be able to recover ρ from μ^* . For $E \in \mathcal{E}$, $\mu^*(E) \leq \rho(E)$ (but we may not get equality).

PROOF First, $0 \leq \mu^*(\emptyset) \leq \rho(\emptyset) = 0$. Second, if $A \subseteq B \subseteq X$, then any countable \mathcal{E} -cover of B is evidently an \mathcal{E} -cover of A . Finally, suppose $A_1, A_2, \dots \subseteq X$ and let $\epsilon > 0$. By definition of μ^* to each A_i , get E_{i1}, E_{i2}, \dots in \mathcal{E} such that $A_i \subseteq \bigcup_{j=1}^{\infty} E_{ij}$ and $\sum_{j=1}^{\infty} \rho(E_{ij}) < \mu^*(A_i) + \frac{\epsilon}{2^i}$. Then $\bigcup_{i=1}^{\infty} A_i \subseteq \bigcup_{i=1}^{\infty} \bigcup_{j=1}^{\infty} E_{ij}$ so that

$$\begin{aligned} \mu^*\left(\bigcup_{i=1}^{\infty} A_i\right) &\subseteq \sum_{i=1}^{\infty} \sum_{j=1}^{\infty} \rho(E_{ij}) \\ &\leq \sum_{i=1}^{\infty} \left(\mu^*(A_i) + \frac{\epsilon}{2^i} \right) \\ &= \sum_{i=1}^{\infty} \mu^*(A_i) + \epsilon \end{aligned}$$

Since ϵ is arbitrary, the inequality holds. ■

Definition. (Caratheodory) Given an outer measure μ^* on X , we say that a set $A \subseteq X$ is μ^* -**measurable** provided that for any $E \in \mathcal{P}(X)$, $\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \setminus A)$.

Remark. If μ^* is an outer measure, $\mu^*(E) \leq \mu^*(E \cap A) + \mu^*(E \setminus A)$ always happens. In practice, we only need check “ \geq ”.

Definition. Given a non-empty set X , an **algebra** on X is a family $\mathcal{A} \subseteq \mathcal{P}(X)$ such that

- (i) $X \in \mathcal{A}$
- (ii) $A \in \mathcal{A} \Rightarrow X \setminus A \in \mathcal{A}$
- (iii) $A, B \in \mathcal{A} \Rightarrow A \cup B \in \mathcal{A}$

By induction, any finite union of sets is in \mathcal{A} . As for σ -algebras, $\emptyset \in \mathcal{A}$ and \mathcal{A} is closed under finite intersections.

2.2 Theorem. Given an outer measure $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$, we have that

- (i) $\mathcal{M} = \{A \in \mathcal{P}(X) : \forall E \in \mathcal{E}(X), \mu^*(E) \geq \mu^*(E \cap A) + \mu^*(E \setminus A)\}$ is a σ -algebra.
- (ii) $\mu = \mu^*|_{\mathcal{M}} : \mathcal{M} \rightarrow [0, \infty]$ is a complete measure.

PROOF (I) Let us verify first that \mathcal{M} is an algebra. First, if $E \in \mathcal{P}(X)$, then $\mu^*(E \cap X) + \mu^*(E \setminus X) = \mu^*(E) + \mu^*(\emptyset) \leq \mu^*(E)$. Now, let $A, B \in \mathcal{M}$. We have for $E \in \mathcal{P}(X)$ that

$$\mu^*(E \cap (X \setminus A)) + \mu^*(E \setminus (X \setminus A)) = \mu^*(E \setminus A) + \mu^*(E \cap A) \leq \mu^*(E)$$

so that $X \setminus A \in \mathcal{M}$. Furthermore,

$$\begin{aligned} \mu^*(E) &\geq \mu^*(E \cap A) + \mu^*(E \setminus A) \\ &\geq \mu^*((E \cap A) \cap B) + \mu^*((E \cap A) \setminus B) + \mu^*((E \setminus A) \cap B) + \mu^*((E \setminus A) \setminus B) \\ &= \mu^*(E \cap (A \cap B)) + \mu^*(E \cap (A \setminus B)) + \mu^*(E \cap (B \setminus A)) + \mu^*(E \setminus (A \cup B)) \\ &\geq \mu^*(E \cap (A \cup B)) + \mu^*(E \setminus (A \cup B)) \end{aligned}$$

by σ -additivity and that $A \cup B = (A \cap B) \cup (A \setminus B) \cup (B \setminus A)$. Thus $A \cup B \in \mathcal{M}$.

(II) For (i), it remains to show closure under countable unions. Let $A_1, A_2, \dots \in \mathcal{M}$ and $A = \bigcup_{i=1}^{\infty} A_i$. Let $B_1 = A_1$, $B_{n+1} = A_{n+1} \setminus \bigcup_{i=1}^n A_i$, so $B_i \cap B_j = \emptyset$. Each $B_i \in \mathcal{M}$, and $\bigcup_{i=1}^n B_i = \bigcup_{i=1}^n A_i$. We have

$$\begin{aligned} \mu^*(E \cap \bigcup_{i=1}^n B_i) &\geq \mu^*\left(E \cap \bigcup_{i=1}^n B_i\right) + \mu^*\left(E \cap \bigcup_{i=1}^n B_i \setminus B_n\right) \\ &= \mu^*(E \cap B_n) + \mu^*\left(E \cap \bigcup_{i=1}^{n-1} B_i\right) \\ &= \mu^*(E \cap B_n) + \mu^*(E \cap B_{n-1}) + \mu^*\left(E \cap \bigcup_{i=1}^{n-2} B_i\right) \\ &= \sum_{i=1}^n \mu^*(E \cap B_i) \end{aligned}$$

Thus we have that

$$\begin{aligned} \mu^*(E) &\geq \mu^*\left(E \cap \bigcup_{i=1}^n A_i\right) + \mu^*\left(E \setminus \bigcup_{i=1}^n A_i\right) \\ &\geq \mu^*\left(E \cap \bigcup_{i=1}^n B_i\right) + \mu^*(E \setminus A) \\ &\geq \sum_{i=1}^n \mu^*(E \cap B_i) + \mu^*(E \setminus A) \end{aligned}$$

so, taking the limit,

$$\begin{aligned}
 \mu^*(E) &\geq \sum_{i=1}^{\infty} \mu^*(E \cap B_i) + \mu^*(E \setminus A) \\
 &\geq \mu^*\left(\bigcup_{i=1}^{\infty} (E \cap B_i)\right) + \mu^*(E \setminus A) \\
 &= \mu^*(E \cap A) + \mu^*(E \setminus A)
 \end{aligned} \tag{*}$$

so that $A \in \mathcal{M}$. Thus (i) is established.

For (ii), assume $A_1, A_2, \dots \in \mathcal{M}$, above, that $A_i \cap A_j = \emptyset$ for $i \neq j$. Then $B_i = A_i$ for each i . Set $E = A$. From (*), we see that

$$\begin{aligned}
 \mu^*(A) &\geq \sum_{i=1}^{\infty} \mu^*(A \cap A_i) + \mu(A \setminus A) \\
 &= \sum_{i=1}^{\infty} \mu^*(A_i) \\
 &\geq \mu^*\left(\bigcup_{i=1}^{\infty} A_i\right) = \mu^*(A)
 \end{aligned}$$

(III) Let us see that if $N \in \mathcal{M}$ with $\mu(N) = 0$, then $E \in \mathcal{M}$ for each $E \subseteq N$. That is, μ is complete. We have for an $F \in \mathcal{P}(X)$ and E as above, then

$$\begin{aligned}
 \mu^*(F \cap E) + \mu^*(F \setminus E) &\leq \mu^*(N) + \mu^*(F) \\
 &= \mu(N) + \mu^*(F) \\
 &= \mu^*(F)
 \end{aligned}$$

■

3 PRE-MEASURES

Definition. Let \mathcal{A} be an algebra on X . A **premeasure** is a function $\mu_0 : \mathcal{A} \rightarrow [0, \infty]$ such that

(i) $\mu_0(\emptyset) = 0$

(ii) If $A_1, A_2, \dots \in \mathcal{A}$ with $A_i \cap A_j = \emptyset$, and $\bigcup_{i=1}^{\infty} A_i \in \mathcal{A}$, then $\mu_0(\bigcup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} \mu_0(A_i)$.

A **premeasure space** is a triple (X, \mathcal{A}, μ_0) .

Since \mathcal{A} is an algebra, μ_0 respects finite unions. As with measures, premeasures are monotone: $A \subseteq B$ in \mathcal{A} implies $\mu_0(A) \leq \mu_0(B)$.

3.1 Theorem. Let (X, \mathcal{A}, μ_0) be a premeasure space. Let $\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$ be given by

$$\mu^*(E) = \inf \left\{ \sum_{i=1}^{\infty} \mu_0(A_i) : A_1, A_2, \dots \in \mathcal{A}, E \subseteq \bigcup_{i=1}^{\infty} A_i \right\}$$

so μ^* is an outer measure.

(i) $\mu^*|_{\mathcal{A}} = \mu_0$

- (ii) The set \mathcal{M} of μ^* -measurable sets contains \mathcal{A} . Hence, $\mu = \mu^*|_{\mathcal{M}}$ satisfies $\mu|_{\mathcal{A}} = \mu_0$.
- (iii) If $\nu : \mathcal{M} \rightarrow [0, \infty]$ is a measure with $\nu|_{\mathcal{A}} = \mu_0$, then $\nu(E) \leq \mu(E)$ for all $E \in \mathcal{M}$, with $\nu(E) = \mu(E)$ if $\mu(E) < \infty$. In particular, if (X, \mathcal{M}, μ) is σ -finite, then μ is the unique extension of μ_0 to a measure on \mathcal{M} .

PROOF That μ^* is an outer measure follows from a prior proposition.

- (i) Let $A \in \mathcal{A}$. Since $A \subseteq A$, $\mu^*(A) \leq \mu_0(A)$ by definition of μ^* . Conversely, let $A_1, A_2, \dots \in \mathcal{A}$ be such that $A \subseteq \bigcup_{i=1}^{\infty} A_i$. Let $B_1 = A_1$, $B_{n+1} = A_{n+1} \setminus \bigcup_{i=1}^n A_i$, so $B_i \in \mathcal{A}$, $B_i \cap B_j = \emptyset$ for $i \neq j$. Thus

$$A = A \cap \bigcup_{i=1}^{\infty} A_i = A \cap \bigcup_{i=1}^{\infty} B_i = \bigcup_{i=1}^{\infty} (A \cap B_i)$$

where $(A \cap B_i) \cap (A \cap B_j) = \emptyset$ for $i \neq j$. Hence, by restricted σ -additivity,

$$\begin{aligned} \mu_0(A) &= \mu_0\left(\bigcup_{i=1}^{\infty} (A \cap B_i)\right) = \sum_{i=1}^{\infty} \mu_0(A \cap B_i) \\ &\leq \sum_{i=1}^{\infty} \mu_0(A_i) \end{aligned}$$

By definition of μ^* , we see that $\mu_0(A) \leq \mu^*(A)$.

- (ii) Now, let $A \in \mathcal{A}$, let $E \in \mathcal{P}(X)$. By definition of $\mu^*(E)$, given $\epsilon > 0$, we can get $A_1, A_2, \dots \in \mathcal{A}$ such that $E \subseteq \bigcup_{i=1}^{\infty} A_i$ and

$$\sum_{i=1}^{\infty} \mu_0(A_i) \leq \mu^*(E) + \epsilon$$

Then, for each i , $\mu_0(A_i) = \mu_0(A_i \cap A) + \mu_0(A_i \setminus A)$ by finite additivity, and $E \cap A \subseteq \bigcup_{i=1}^{\infty} (A_i \cap A)$, $E \setminus A \subseteq \bigcup_{i=1}^{\infty} (A_i \setminus A)$. Thus

$$\begin{aligned} \mu^*(E) + \epsilon &\geq \sum_{i=1}^{\infty} \mu_0(A_i) \\ &= \sum_{i=1}^{\infty} \mu_0(A_i \cap A) + \sum_{i=1}^{\infty} \mu_0(A_i \setminus A) \\ &\geq \mu^*(E \cap A) + \mu^*(E \setminus A) \end{aligned}$$

and since ϵ was arbitrary, we see that the desired inequality must hold.

- (iii) We will use continuity from below several times. If $E \in \mathcal{M}$ and $A_1, A_2, \dots \in \mathcal{A}$ are such that $E \subseteq \bigcup_{i=1}^{\infty} A_i$, then

$$\nu(E) \leq \nu\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \sum_{i=1}^{\infty} \nu(A_i) = \sum_{i=1}^{\infty} \mu_0(A_i)$$

and it follows from definition of $\mu = \mu^*|_{\mathcal{M}}$ and $\nu(E) \leq \mu(E)$.

Recall, from A1, that $\mathcal{A}_\sigma = \{\bigcup_{i=1}^\infty A_i : A_1, A_2, \dots \in \mathcal{A}\}$. Then we have that $\mu|_{\mathcal{A}_\sigma} = \mu|_{\mathcal{A}_\sigma}$. If $A = \bigcup_{i=1}^\infty A_i$, $A_i \in \mathcal{A}$, then

$$\begin{aligned} \nu(A) &= \lim_{n \rightarrow \infty} \nu\left(\bigcup_{i=1}^n A_i\right) \\ &= \lim_{n \rightarrow \infty} \mu_0\left(\bigcup_{i=1}^n A_i\right) \\ &= \lim_{n \rightarrow \infty} \mu\left(\bigcup_{i=1}^n A_i\right) = \mu(A) \end{aligned}$$

Now, let $E \in \mathcal{M}$ with $\mu(E) < \infty$. Given $\epsilon > 0$, let $A_1, A_2, \dots \in \mathcal{A}$ with $E \subseteq \bigcup_{i=1}^\infty A_i$ and such that

$$\mu(E) + \epsilon = \mu^*(E) + \epsilon > \sum_{i=1}^\infty \mu_0(A_i)$$

Hence, $\mu(E) \leq \mu(A) \leq \sum_{i=1}^\infty \mu(A_i) = \sum_{i=1}^\infty \mu_0(A_i) < \mu(E) + \epsilon$. Thus $\mu(A \setminus E) = \mu(A) - \mu(E) < \epsilon$. Hence, as $A \in \mathcal{A}_\sigma$, $\mu(A) = \nu(A)$ and we have

$$\begin{aligned} \mu(E) &\leq \mu(A) = \nu(A) = \nu(A \cap E) + \nu(A \setminus E) \\ &\leq \nu(A \cap E) + \mu(A \setminus E) \\ &= \nu(E) + \epsilon \end{aligned}$$

Since $\epsilon > 0$ is arbitrary, $\mu(E) \leq \nu(E)$, so equality must hold.

Now, if (X, \mathcal{M}, μ) is σ -finite, we can write $X = \bigcup_{i=1}^\infty X_i$ where $X_i \in \mathcal{M}$, $\mu(X_i) < \infty$, and $X_1 \subseteq X_2 \subseteq \dots$. If $E \in \mathcal{M}$, then $E = \bigcup_{i=1}^\infty (X_i \cap E)$, so

$$\begin{aligned} \mu(E) &= \lim_{n \rightarrow \infty} \mu(X_n \cap E) \\ &= \lim_{n \rightarrow \infty} \nu(X_n \cap E) = \nu(E) \end{aligned} \quad \blacksquare$$

Remark. The uniqueness also holds if we have that (X, \mathcal{M}, μ) is semifinite. Indeed, by A1, if $E \in \mathcal{M}$,

$$\mu(E) = \sup\{\mu(F) : F \in \mathcal{M}, F \subseteq E, \mu(F) < \infty\} = \sup\{\nu(F) : F \in \mathcal{M}, F \subseteq E, \mu(F) < \infty\} \leq \nu(E) \leq \mu(E)$$

3.2 Corollary. *Given a measure space (X, \mathcal{M}, μ) , there is a complete measure space $(X, \overline{\mathcal{M}}, \overline{\mu})$ such that $\overline{\mu}|_{\mathcal{M}} = \mu$. Furthermore, if (X, \mathcal{M}, μ) is a σ -finite then any $E \in \mathcal{M}$ admits a representation of the form $E = M \cup N$, where $M \in \mathcal{M}$, $N \subseteq N'$ where $N' \in \mathcal{M}$ with $\mu(N') = 0$.*

PROOF We regard (X, \mathcal{M}, μ) is a pre-measure space. Then the last theorem provides an outer measure μ^* so that $\mu^*|_{\mathcal{M}} = \mu$ and if

$$\mathcal{M} = \{A \in \mathcal{P}(X) : \mu^*(E) \geq \mu^*(E \cap A) + \mu^*(E \setminus A) \forall E \in \mathcal{P}(X)\}$$

then $\mathcal{M} \subseteq \overline{\mathcal{M}}$. Let $\overline{\mu} = \mu^*|_{\overline{\mathcal{M}}}$. We appeal to A1, Q4 to see the structure of $E \in \overline{\mathcal{M}}$. We have $X \setminus E \in \mathcal{M}$ and we have $X \setminus E = A \setminus M$, where $A \in \mathcal{M}_{\sigma\delta}$ and $\mu^*(N) = 0$. For each n , we

can find $A_{n1}, A_{n2}, \dots \in \mathcal{A}$ such that $N \subseteq \bigcup_{i=1}^{\infty} A_{ni} := A_n$ and $\sum_{i=1}^{\infty} \mu(A_{ni}) < 1/n = \mu^*(N) + 1/n$. Thus $N \subseteq A_n$, $A_n \in \mathcal{M}$. Thus $N \subseteq \bigcap_{n=1}^{\infty} A_n = N'$ and $N' \in \mathcal{M}$ and $\mu(N') \leq \mu(A_n) < 1/n$ for each n . Now,

$$\begin{aligned} E &= X \setminus (X \setminus E) \\ &= X \setminus (A \setminus N) \\ &= (X \setminus A) \cup N \end{aligned}$$

■

The past few theorems give an important abstract construction: given (X, \mathcal{A}, μ_0) premeasure, get an outer measure μ^* , and by Caratheodory, extract a measure space (X, \mathcal{M}, μ) , $\mathcal{M} \supseteq \mathcal{A}$, $\mu|_{\mathcal{A}} = \mu_0$.

4 BUILDING σ -ALGEBRAS

4.1 Lemma. Let X be a non-empty set.

- (i) If $\{M_i\}_{i \in I}$ is a family of σ -algebras on X , then $\bigcap_{i \in I} M_i \subseteq \mathcal{P}(X)$.
- (ii) Given $\emptyset \neq \mathcal{E} \subseteq \mathcal{P}(X)$, the family $\sigma\langle \mathcal{E} \rangle = \bigcap \{ \mathcal{M} : \mathcal{M} \text{ is a } \sigma\text{-algebra on } X, \mathcal{E} \subseteq \mathcal{M} \}$. This is the σ -**algebra generated by \mathcal{E}** .
- (iii) If $\emptyset \neq \mathcal{F} \subseteq \sigma\langle \mathcal{E} \rangle$ in $\mathcal{P}(X)$, then $\sigma\langle \mathcal{F} \rangle = \sigma\langle \mathcal{E} \rangle$.

PROOF (i) It is easy to check the σ -algebra axioms.

(ii) Application of (i)

(iii) We see that $\sigma\langle \mathcal{E} \rangle$ is a σ -algebra containing \mathcal{F} . Part (ii) tells us that $\sigma\langle \mathcal{F} \rangle$ is the smallest σ -algebra containing \mathcal{F} . ■

As with (ii), we may define $\langle \mathcal{A} \rangle = \bigcap \{ \mathcal{A} : \mathcal{A} \text{ is an algebra on } X, \mathcal{E} \subseteq \mathcal{A} \}$.

Definition. Let (X, τ) be a topological space. The **Borel σ -algebra** $\mathcal{B}(X, \tau) = \mathcal{B}(X) = \sigma\langle \tau \rangle$.

Remark. If $\mathcal{F} = \{F \subseteq X : F \text{ is closed}\}$, then $\mathcal{F} \subseteq \sigma\langle \tau \rangle$. Thus $\sigma\langle \mathcal{F} \rangle \subseteq \sigma\langle \mathcal{G} \rangle$. Similarly, the opposite inclusion holds, so these sets are equal.

4.2 Proposition. Let $\mathcal{B}(\mathbb{R})$ denote the Borel σ -algebra on \mathbb{R} . Consider the following families of subsets of \mathbb{R} :

1. $\mathcal{O} = \{(a, b) : -\infty \leq a \leq b \leq \infty\}$, $(a, a) = \emptyset$.
2. $\mathcal{O}_{\infty} = \{(a, \infty) : -\infty \leq a \in \mathbb{R}\}$.
3. $\mathcal{H} = \{(a, b] : -\infty \leq a \leq b \leq \infty \text{ in } \mathbb{R}\}$, $(a, \infty] = (a, \infty)$, $(a, a] = \emptyset$.
4. $\mathcal{C}_{\infty} = \{[a, \infty) : -\infty < a \in \mathbb{R}\}$.

Then $\mathcal{B}(\mathbb{R}) = \sigma\langle \mathcal{O} \rangle = \sigma\langle \mathcal{O}_{\infty} \rangle = \sigma\langle \mathcal{H} \rangle = \sigma\langle \mathcal{C}_{\infty} \rangle$.

PROOF This follows since τ has a countable base. ■

Definition. An **elementary family** of sets on X is any $\mathcal{E} \subseteq \mathcal{P}(X)$ such that

- (i) $X \in \mathcal{E}$
- (ii) If $E, F \in \mathcal{E}$, $E \cap F = \bigcup_{i=1}^m E_i$ with $E_i \in \mathcal{E}$
- (iii) If $E \in \mathcal{E}$, $X \setminus F = \bigcup_{j=1}^m E_j$, $E_1, \dots, E_j \in \mathcal{E}$.

A simple induction argument shows that any finite intersection of elements of \mathcal{E} is a finite union of elements in \mathcal{E} .

Example. In \mathbb{R} , $\mathcal{H} = \{(a, b] : -\infty \leq a \leq b \leq \infty\}$ is an elementary family.

4.3 Lemma. If $\mathcal{E} \subseteq \mathcal{P}(X)$ is an elementary family, then $\mathcal{E} = \{\bigcup_{i=1}^n E_i, E_i \in \mathcal{E}, n \in \mathbb{N}\}$.

PROOF It suffices to see that the RHS is an algebra. It is clearly closed under finite unions. Let $E_1, \dots, E_n \in \mathcal{E}$, and write each $X \setminus E_i = \bigcup_{j=1}^m E_{ij}$. Now we consider

$$\begin{aligned} X \setminus \left(\bigcup_{i=1}^n E_i \right) &= \bigcap_{i=1}^n (X \setminus E_i) = \bigcap_{i=1}^n \bigcup_{j=1}^m E_{ij} \\ &= \bigcup_{1 \leq j_1 \leq n, 1 \leq i_1 \leq m} E_{i_1 j_1} \cap \dots \cap E_{n j_n} \end{aligned}$$

where each finite intersection is a finite union of elements of \mathcal{E} by the last remark. ■

4.4 Corollary. In \mathbb{R} , $\langle \mathcal{H} \rangle = \{\bigcup_{i=1}^n (a_i, b_i] : -\infty \leq a_i \leq b_i \leq \infty\}$.

Let $\mathcal{A} = \langle \mathcal{H} \rangle \subseteq \mathcal{P}(\mathbb{R})$. We will build many premeasures on \mathcal{A} .

5 MEASURES ON \mathbb{R}

Definition. We consider the non-decreasing, right-continuous functions

$$\text{ND}_r(\mathbb{R}) = \{F : \mathbb{R} \rightarrow \mathbb{R} \mid x < y \Rightarrow F(x) \leq F(y); \lim_{x \rightarrow a^+} F(x) = F(a)\}$$

5.1 Lemma. Let $F \in \text{ND}_r(\mathbb{R})$ and $\mathcal{A} = \langle \mathcal{H} \rangle \subset \mathcal{P}(\mathbb{R})$, the algebra generated by half-open half-closed intervals. Then $\mu_{0,F} : \mathcal{A} \rightarrow [0, \infty]$,

$$\mu_{0,F} \left(\bigcup_{i=1}^n (a_i, b_i] \right) = \sum_{i=1}^n (F(b_i) - F(a_i))$$

Here, $b - (-\infty) = \infty$ for $-\infty < b \leq \infty$.

PROOF For simplicity, write $\mu_0 = \mu_{0,F}$. It is evident that μ_0 is well-defined and that $\mu_0(\emptyset) = 0$. It remains to show that μ_0 has restricted σ -additivity.

(I) Suppose $(a, b] = \bigcup_{j=1}^\infty (c_j, d_j]$, $-\infty < a < b < \infty$. We wish to see that $\mu_0((a, b]) = \sum_{j=1}^\infty \mu_0((c_j, d_j])$. First, given $n \in \mathbb{N}$, there is a bijection $\sigma : [n] \rightarrow [n]$ such that $c_{\sigma(1)} \leq d_{\sigma(1)} \leq \dots \leq c_{\sigma(n)} \leq d_{\sigma(n)}$. Then, as F is non-decreasing, we have

$$\begin{aligned} \sum_{j=1}^n \mu_0((c_j, d_j]) &= \sum_{j=1}^n (F(d_j) - F(c_j)) \\ &= \sum_{j=1}^n (F(d_{\sigma(j)}) - F(c_{\sigma(j)})) \\ &= F(d_{\sigma(n)}) - F(c_{\sigma(n)}) + \underbrace{F(d_{\sigma(n-1)}) + \dots - F(c_{\sigma(1)})}_{\leq 0} \\ &\leq F(d_{\sigma(n)}) - F(c_{\sigma(n)}) \\ &\leq \mu_0((a, b]) \end{aligned}$$

To see the converse inequality, let $\epsilon > 0$ and, since F is right-continuous, we may find

- $\delta_0 > 0$ such that $a + \delta_0 < b$ and $F(a + \delta_0) < F(a) + \epsilon/2$.
- for each j , find $\delta_j > 0$ such that $F(d_j + \delta_j) < F(d_j) + \epsilon/2^{j+1}$

Then $\{(c_j, d_j + \delta_j)\}_{j=1}^{\infty}$ is a cover of $[a + \delta_0, b]$ and hence, by compactness, we have that $[a + \delta_0, b] \subseteq \bigcup_{j=1}^n (c_j, d_j + \delta_j)$ for some n . Let $\sigma : [n] \rightarrow [n]$ be as in (f). Notice that

- $c_{\sigma(1)} < a_{\delta_0}$ implies $F(c_{\sigma(1)}) \leq F(a + \delta_0) < F(a) + \epsilon/2$.
- For $j = 1, \dots, n-1$, $c_{\sigma(j+1)} < d_{\sigma(j)} + \delta_{\sigma(j)}$ implies $F(c_{\sigma(j+1)}) \leq F(d_{\sigma(j)} + \delta_{\sigma(j)}) < F(d_{\sigma(j)}) + \epsilon/2^{\sigma(j)+1}$
- $b < d_{\sigma(n)} + \delta_{\sigma(n)}$ implies $F(b) < F(d_{\sigma(n)} + \delta_{\sigma(n)}) < F(d_{\sigma(n)}) + \epsilon/2^{\sigma(n)+1}$.

Thus

$$\begin{aligned}
 \sum_{j=1}^{\infty} \mu_0((c_j, d_j]) &\geq \sum_{j=1}^n \mu_0((c_j, d_j]) \\
 &= \sum_{j=1}^n (F(d_j) - F(c_j)) \\
 &= F(d_{\sigma(n)}) + \sum_{j=1}^{n-1} (F(d_{\sigma(j)}) - F(c_{\sigma(j+1)})) - F(c_{\sigma(1)}) \\
 &> \left(F(b) - \frac{\epsilon}{2^{\sigma(n)+1}}\right) + \sum_{j=1}^{n-1} \left(-\frac{\epsilon}{2^{\sigma(j)+1}}\right) - \left(F(a) + \frac{\epsilon}{2}\right) \\
 &> F(b) - F(a) - \epsilon = \mu_0((a, b]) - \epsilon
 \end{aligned}$$

and since $\epsilon > 0$ is arbitrary, our desired inequality holds.

(I') Do similar for $(-\infty, b]$, $(a, \infty]$ (Exercise).

(II) If $A, A_1, A_2, \dots \in \mathcal{A}$, $A = \bigcup_{j=1}^{\infty} (a_i, b_i]$ and for each i, j , $(a_i, b_i] \cap A_j = \bigcup_{k=1}^{m_{ij}} (c_{ijk}, d_{ijk}]$. From (I), (I'), we have that

$$(a_i, b_i] = \bigcup_{j=1}^{\infty} \bigcup_{k=1}^{m_{ij}} (c_{ijk}, d_{ijk}]$$

so that

$$\mu_0((a_i, b_i]) = \sum_{j=1}^{\infty} \sum_{k=1}^{m_{ij}} \mu_0((c_{ijk}, d_{ijk}])$$

so we have

$$\begin{aligned}
 \mu_0(A) &= \sum_{i=1}^n \mu_0((a_i, b_i]) \\
 &= \sum_{i=1}^n \sum_{j=1}^{\infty} \sum_{k=1}^{m_{ij}} \mu_0((c_{ijk}, d_{ijk}]) \\
 &= \sum_{j=1}^{\infty} \sum_{i=1}^n \sum_{k=1}^{m_{ij}} \mu_0((c_{ijk}, d_{ijk}]) \\
 &= \sum_{j=1}^{\infty} \mu_0(A_j)
 \end{aligned}$$

since each $A_j = \bigcup_{i=1}^n \bigcup_{k=1}^{m_{ij}} (c_{ijk}, d_{ijk}]$. ■

Definition. A measure $\mu : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$ is called **locally finite** if $\mu_0([-a, a]) < \infty$ for $a > 0$ in \mathbb{R} .

This is equivalent to having $\mu(K) < \infty$ for each compact $K \subset \mathbb{R}$. As well, locally finite measures are σ -finite.

- 5.2 Theorem.** (i) For each F in $\text{ND}_r(\mathbb{R})$, there is a unique locally finite measure $\mu_F : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$ such that $\mu_F((a, b]) = F(b) - F(a)$ for any finite a, b .
 (ii) Every locally finite measure appears as in (i)
 (iii) If $F, G \in \text{ND}_r(\mathbb{R})$, then $\mu_F = \mu_G$ if and only if $F - G$ is constant.

PROOF 1. The last lemma provides a premeasure $(\mathbb{R}, \langle \mathcal{H} \rangle, \mu_{0,F})$, where $\mu_{0,F}((a, b]) = F(b) - F(a)$ for $-\infty \leq a \leq b \leq \infty$. This gives rise to a measure $\mu_F^* : \mathcal{P}(\mathbb{R}) \rightarrow [0, \infty]$, and its σ -algebra \mathcal{F} of μ_F^* -measurable sets. Notice that a prior proposition provides that $\mathcal{B}(\mathbb{R}) = \sigma\langle \mathcal{H} \rangle$, so since $\mathcal{H} \subseteq \langle \mathcal{H} \rangle \subseteq \mathcal{M}_F$, we have that $\mathcal{B}(\mathbb{R}) = \sigma\langle \mathcal{H} \rangle \subseteq \mathcal{M}_F$. Then, we let $\mu_F = \mu_F^*|_{\mathcal{B}(\mathbb{R})} : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$. Notice, for $a > 0$ in \mathbb{R} , that

$$\mu_F([-a, a]) \leq \mu_F((-a-1, a]) = F(a) - F(-a-1) < \infty$$

so μ_F is locally finite, and hence σ -finite. Thus μ_F is the unique extension of $\mu_{0,F}$ to $\mathcal{B}(\mathbb{R})$ (or even to \mathcal{M}_F).

2. Let $\mu : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$ be a locally finite measure. Then for $x \in \mathbb{R}$, we let

$$F(x) = \begin{cases} \mu((0, x]) & : x \geq 0 \\ -\mu((x, 0]) & : x < 0 \end{cases}$$

We will see that $F \in \text{ND}_r(\mathbb{R})$. If $x < y$ in \mathbb{R} :

- If $x \geq 0$, then $(0, x] \subseteq (0, y]$ so $F(x) = \mu((0, x]) \leq \mu((0, y]) = F(y)$
- If $y < 0$, then $(y, 0] \subseteq (x, 0]$ so $\mu((y, 0]) \leq \mu((x, 0])$, so $F(x) = -\mu((x, 0]) \leq -\mu((y, 0]) = F(y)$.
- If $x < 0 \leq y$, then $F(x) = -\mu((x, 0]) \leq 0 \leq \mu((0, y]) = F(y)$.

To see right continuity, it suffices to see for $x \in \mathbb{R}$, we have $F(x) = \lim_{n \rightarrow \infty} F(x_n)$, where $(x_n) \rightarrow x$ monotonically from the right. Thus, given x , $(x_n)_{n=1}^{\infty}$, we have

$$F(x_n) - F(x) = \mu((x, x_n]) \xrightarrow{n \rightarrow \infty} \mu(\emptyset) = 0$$

by continuity from above for measures.

Notice that for $a < b$ in \mathbb{R} , $\mu_F((a, b]) = \mu((a, b])$, which by uniqueness in part (i) shows that $\mu = \mu_F$.

3. $\mu_F = \mu_G$ if and only if for $x \in \mathbb{R}$,

$$\begin{cases} F(x) - F(0) = \mu_F((0, x]) = \mu_G((0, x]) = F(x) - G(0) & : x \geq 0 \\ F(0) - F(x) = \mu_F((x, 0]) = \mu_G((x, 0]) = G(0) - G(x) & : x < 0 \end{cases}$$

if and only if $F(x) - G(x) = F(0) - G(0)$ is constant. ■

Let $F \in \text{ND}_r(\mathbb{R})$, $a < b$ in \mathbb{R} ,

1. $(a, b) = \bigcup_{n=1}^{\infty} (a, b - 1/n]$ so

$$\begin{aligned} \mu_F((a, b)) &= \lim_{n \rightarrow \infty} \mu_F((a, b - 1/n]) \\ &= \lim_{n \rightarrow \infty} [F(b - 1/n) - F(a)] \\ &= F(b^-) - F(a) \end{aligned}$$

2. As above,

$$\begin{aligned} \mu_F([a, b]) &= \lim_{n \rightarrow \infty} \mu_F((a - 1/n, b]) \\ &= F(b) - F(a^-) \end{aligned}$$

In particular, $\mu_F(\{a\}) = \mu_F([a, a]) = F(a) - F(a^-)$, so $\mu_F(\{a\}) = 0$ if and only if F is continuous at a .

POINT MASS/DIRAC MEASURE

Fix $a \in \mathbb{R}$. Let $H_a \in \text{ND}_r(\mathbb{R})$ where

$$H_a(x) = 1_{[a, \infty)}(x) = \begin{cases} 1 & : x \in [a, \infty) \\ 0 & : \text{otherwise} \end{cases}$$

Let $\delta_a : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$, where

$$\delta_a(A) = \begin{cases} 1 & : a \in A \\ 0 & : a \notin A \end{cases}$$

Notice that if $c < d$ in \mathbb{R} , then

$$\delta_a((c, d]) = \begin{cases} 1 & : c < a \leq d \\ 0 & : \text{otherwise} \end{cases} = H_a(d) - H_a(c)$$

LEBESGUE MEASURE

Let $I(x) = x$, $I \in \text{ND}_r(\mathbb{R})$. We let $\lambda = \mu_I$ and $\mathcal{L} = \mathcal{M}_I \supseteq \mathcal{B}(\mathbb{R})$ denote the Lebesgue measure and Lebesgue σ -algebra.

- 5.3 Theorem.** 1. $(\mathbb{R}, \mathcal{L}, \lambda)$ is translation invariant: for $x \in \mathbb{R}$, $E \in \mathcal{L}$, we have $E + x \in \mathcal{L}$ and $\lambda(E + x) = \lambda(E)$.
 2. If $\mu : \mathcal{B}(\mathbb{R}) \rightarrow [0, \infty]$ is a locally finite measure, which is translation-invariant. Then $\mu = c\lambda$ for some $c \geq 0$ in \mathbb{R} .

PROOF (I) If $-\infty \leq a \leq b \leq \infty$, then $\lambda((a, b] + x) = \mu_I((a + x, b + x]) = b - a = \lambda((a, b])$. Hence if $A \in \langle H \rangle$, $\mu_I(A + x) = \mu_I(A)$ for $x \in \mathbb{R}$. If $E \in \mathcal{P}(\mathbb{R})$, $E \subseteq \bigcup_{i=1}^{\infty} A_i$, $A_i \in \langle H \rangle$ if and only if $E + x \subseteq \bigcup_{i=1}^{\infty} (A_i + x)$. Thus, by definition of μ_I^* , we see that $\mu_I^*(E + x) = \mu_I^*(E)$. Now, if $A \in \mathcal{L}$, $E \in \mathcal{P}(\mathbb{R})$, then

$$\begin{aligned} \mu_I^*(E \cap (A + x)) + \mu_I^*(E \setminus (A + x)) &= \mu_I^*([(E - x) \cap A] + x) + \mu_I^*([(E - x) \setminus A] + x) \\ &= \mu_I^*((E - x) \cap A) + \mu_I^*((E - x) \setminus A) \\ &\leq \mu_I^*(E - x) = \mu_I^*(E) \end{aligned}$$

so $A + x \in \mathcal{L}$.

(II) We let $\mu = \mu_F$ where $F \in \text{ND}_r(\mathbb{R})$. In fact, we may let $F(0) = 0$, so

$$F(x) = \begin{cases} \mu((0, x]) & : x \geq 0 \\ -\mu((x, 0]) & : x < 0 \end{cases}$$

Then for $y \geq 0$, we have

$$F(y) = \mu((0, y]) = \mu((x, x + y]) = F(x + y) - F(x)$$

so $F(x) + F(y) = F(x + y)$. Thus if $x \geq 0$, $F(nx) = nF(x)$ for $n \in \mathbb{N}$. Thus $F(x/n) = F(x)/n$, $0 = F(0) = F(-x) + F(x)$, $x \geq 0$, so $F(-x) = -F(x)$. Thus $F : \mathbb{R} \rightarrow \mathbb{R}$ is additive and $F(qx) = qF(x)$ for $x \in \mathbb{R}$, $q \in \mathbb{Q}$. Now, given $x \in \mathbb{R}$, let (q_n) be a rational sequence so $q_n \geq x$, $\lim q_n = x$, and we have

$$F(x) = \lim F(q_n) = \lim q_n F(1) = F(1)x$$

Let $c = F(1) = \mu((0, 1]) \geq 0$. By uniqueness, $\mu = \mu_{cI} = c\lambda$. ■

6 CANTOR'S SETS AND FUNCTIONS

Fix $0 < \alpha \leq 1$. Let $I_{01} = [0, 1]$ and J_{01} be the open middle of length $\alpha/3$. Notice that $I_{01} \setminus J_{01} = I_{11} \dot{\cup} I_{12}$, each a closed interval, with $\lambda(I_{1k}) < 1/2$, $k = 1, 2$. Having constructed closed intervals I_{m1}, \dots, I_{m2^m} , each of length at most $1/2^m$, we let for each $k = 1, \dots, 2^m$, J_{mk} denote the open middle of length $\alpha/3^{m+1}$. Then each $I_{mk} \setminus J_{mk} = I_{m+1,2k-1} \dot{\cup} I_{m+1,2k}$.

Let $C_{\alpha,n} = \bigcup_{k=1}^{2^n} I_{nk}$, so $C_{\alpha,n}$ is compact. Notice that $C_{\alpha,1} \supseteq C_{\alpha,2} \supseteq \dots$, then $C_\alpha := \bigcap_{n=1}^{\infty} C_{\alpha,n}$ is empty and compact. If $\alpha = 1$, then $C = C_1$ is called the (middle thirds) **Cantor set**.

Remark. 1. C_α is nowhere dense. Indeed, if $x \in C_\alpha$, $\epsilon > 0$, let n be so $1/2^n < 2\epsilon$ and we see that $(x - \epsilon, x + \epsilon) \not\subseteq I_{nk}$ for any $k = 1, \dots, 2^n$. Thus $(x - \epsilon, x + \epsilon) \cap (\mathbb{R} \setminus C_\alpha) \neq \emptyset$.

2. We can compute

$$\begin{aligned}
\lambda(C_\alpha) &= \lambda([0, 1]) - \lambda([0, 1] \setminus C_\alpha) \\
&= 1 - \lambda\left(\bigcup_{n=1}^{\infty} \bigcup_{k=1}^{2^n} J_{nk}\right) \\
&= 1 - \sum_{n=1}^{\infty} \sum_{k=1}^{2^n} \lambda(J_{nk}) \\
&= 1 - \sum_{n=1}^{\infty} \alpha \frac{2^n}{3} \left(\frac{2}{3}\right)^n \\
&= 1 - \alpha
\end{aligned}$$

In particular, $\lambda(C) = 0$.

Write each $I_{nk} = [a_{nk}, b_{nk}]$. Define $\phi_{\alpha,n} : \mathbb{R} \rightarrow \mathbb{R}$ by

$$\phi_{\alpha,n} = \begin{cases} 0 & : x \in (-\infty, 0) \\ \frac{2k-1}{2^{m+1}} & : x \in J_{mk} \\ \frac{1}{2^n(b_{mk}-a_{mk})}(x - a_{mk}) + c_{mk} & : x \in I_{mk} \\ 1 & : x \in (1, \infty) \end{cases}$$

Each $\phi_{\alpha,n}$ is continuous and non-decreasing on \mathbb{R} , and $\|\phi_{\alpha,n} - \phi_{\alpha,n+1}\| = \frac{1}{2^n}$. Thus $(\phi_{\alpha,n})_{n=1}^{\infty}$ is uniformly Cauchy, so $\phi_\alpha := \lim_{n \rightarrow \infty} \phi_{\alpha,n}$ exists and is continuous. Furthermore, (1) tells us for $x < y$, $\phi_\alpha(x) \leq \phi_\alpha(y)$, so $\phi_\alpha \in \text{ND}_r(\mathbb{R})$ and is, in fact, continuous. We let μ_{ϕ_α} denote the corresponding locally finite measure on $(\mathbb{R}, \mathcal{B}(\mathbb{R}))$. If $\alpha = 1$, $\mu_\phi = \mu_{\phi_1}$ is called the Cantor singular measure.

Note that $\mu_{\phi_\alpha}(C_\alpha) = 1 = \mu_{\phi_\alpha}(\mathbb{R})$, so $\mu_{\phi_\alpha}(\mathbb{R} \setminus C_\alpha) = 0$. We say that μ_{ϕ_α} is **concentrated** on C_α . $\mathcal{M}_{\phi_\alpha} \supseteq \mathcal{P}(\mathbb{R} \setminus C_\alpha)$ as null sets for $\mathcal{M}_{\phi_\alpha}$.

II. Integration Theory

7 MEASURABLE FUNCTIONS

Let X, Y be sets, $T : X \rightarrow Y$. We define the **pullback** of a set $E \in \mathcal{P}(Y)$ by $T^{-1}(E) = \{x \in X : T(x) \in E\}$. If $\mathcal{E} \subseteq \mathcal{P}(Y)$, we write $T^{-1}(\mathcal{E}) = \{T^{-1}(E) : E \in \mathcal{E}\}$. Note that

1. $T^{-1}(Y \setminus E) = X \setminus T^{-1}(E)$
2. $E_1, E_2, \dots \subseteq Y, T^{-1}(\bigcup_{i=1}^{\infty} E_i) = \bigcup_{i=1}^{\infty} T^{-1}(E_i)$.

- 7.1 Proposition.** 1. If \mathcal{N} is a σ -algebra on Y , then $T^{-1}(\mathcal{N})$ is a σ -algebra on X (the pullback σ -algebra)
2. If \mathcal{M} is a σ -algebra on X , then $\{E \in \mathcal{P}(Y) : T^{-1}(E) \in \mathcal{M}\}$ is a σ -algebra on Y

Definition. Let $(X, \mathcal{M}), (Y, \mathcal{N})$ be measurable spaces, and $T : X \rightarrow Y$. We say that T is \mathcal{M} - \mathcal{N} -**measurable** provided that $T^{-1}(\mathcal{N}) \subseteq \mathcal{M}$.

7.2 Proposition. Suppose $(X, \mathcal{M}), (Y, \mathcal{N}), T : X \rightarrow Y$ measurable, and $\mathcal{N} = \sigma\langle \mathcal{E} \rangle$. Then T is \mathcal{M} - \mathcal{N} -measurable if and only if $T^{-1}(E) \in \mathcal{M}$ for $E \in \mathcal{E}$.

PROOF The forward direction is obvious. Conversely, as in the previous proposition, $\mathcal{N}' = \{A \in \mathcal{P}(Y) : T^{-1}(A) \in \mathcal{M}\}$ is a σ -algebra. We have that $\mathcal{E} \subseteq \mathcal{N}'$, so $\mathcal{N} = \sigma\langle \mathcal{E} \rangle \subseteq \mathcal{N}'$. ■

7.3 Corollary. Let (X, \mathcal{M}) be a measurable space, $f : X \rightarrow \mathbb{R}$. Then the following are equivalent:

1. f is \mathcal{M} - $\mathcal{B}(\mathbb{R})$ -measurable
2. $f^{-1}(G) \in \mathcal{M}$ for open $G \subseteq \mathbb{R}$.
3. $f^{-1}((a, \infty)) \in \mathcal{M}$ for a in \mathbb{R}
4. $f^{-1}([a, \infty)) \in \mathcal{M}$ for a in \mathbb{R}
5. $f^{-1}((-\infty, a)) \in \mathcal{M}$ for a in \mathbb{R}
6. $f^{-1}((-\infty, a]) \in \mathcal{M}$ for a in \mathbb{R}

Definition. A function $f : X \rightarrow \mathbb{R}$ satisfying the conditions above will be called \mathcal{M} -**measurable**.

Certainly continuous functions are measurable.

For notation, let $f_n : \mathbb{R} \rightarrow \mathbb{R}, n \in \mathbb{N}$. We let

$$(\sup_{n \in \mathbb{N}} f_n)(x) = \sup_{n \in \mathbb{N}} f_n(x) \in \overline{\mathbb{R}} \quad (\text{II.1})$$

for $x \in \mathbb{R}$. Let $a \in \mathbb{R}, (a, \infty] = \{x \in \overline{\mathbb{R}} : a < x\}$, and let $\mathcal{B}(\overline{\mathbb{R}}) = \sigma\langle \mathcal{G} \cup \{-\infty\}, \{\infty\} \rangle$. Given a measurable space $(X, \mathcal{M}), f : X \rightarrow \overline{\mathbb{R}}$, we say f is \mathcal{M} -measurable if it is \mathcal{M} - $\mathcal{B}(\overline{\mathbb{R}})$ -measurable. Notice that if $f_n : X \rightarrow \mathbb{R}, n \in \mathbb{N}$, then $\sup_{n \in \mathbb{N}} f_n, \inf_{n \in \mathbb{N}} f_n : X \rightarrow \overline{\mathbb{R}}$.

7.4 Proposition. Let (X, \mathcal{M}) be a measurable space, $f_n : X \rightarrow \overline{\mathbb{R}}$, $n \in \mathbb{N}$ each be measurable. Then the following are measurable:

1. $\sup_{n \in \mathbb{N}} f_n$
2. $\inf_{n \in \mathbb{N}} f_n$
3. $\limsup_{n \rightarrow \infty} f_n$
4. $\liminf_{n \rightarrow \infty} f_n$.

Furthermore, if $\lim_{n \rightarrow \infty} f_n$ exists, it too is measurable.

PROOF 1. Fix $a \in \mathbb{R}$. Then

$$\begin{aligned} \left(\sup_{n \in \mathbb{N}} f_n \right)^{-1}((a, \infty]) &= \{x \in X : \sup_{n \in \mathbb{N}} f_n(x) > a\} \\ &= \bigcup_{n=1}^{\infty} \{x \in X : f_n(x) > a\} \in \mathcal{M} \end{aligned}$$

2. For $a \in \mathbb{R}$, we have

$$\left(\inf_{n \in \mathbb{N}} f_n^{-1}([-\infty, a)) \right) = \bigcup_{n=1}^{\infty} \{x \in X : f_n(x) < a\} \in \mathcal{M}$$

3.

$$\limsup_{n \rightarrow \infty} f_n(x) = \inf_{n \in \mathbb{N}} \underbrace{\sup_{k \geq n} f_k(x)}_{\text{measurable}}$$

4. Same as above ■

Definition. If (X, \mathcal{M}) and (Y, \mathcal{N}) are measurable spaces, we let the **product σ -algebra** of \mathcal{M} and \mathcal{N} be given by

$$\mathcal{M} \otimes \mathcal{N} = \sigma\langle \{E \times F : E \in \mathcal{M}, F \in \mathcal{N}\} \rangle \subseteq \mathcal{P}(X \times Y)$$

7.5 Lemma. Let π_X, π_Y denote the coordinate projections. Then

1. $\mathcal{M} \otimes \mathcal{N} = \sigma\langle \pi_X^{-1}(\mathcal{M}) \cup \pi_Y^{-1}(\mathcal{N}) \rangle$
2. If $\mathcal{M} = \sigma\langle \mathcal{E} \rangle, \mathcal{N} = \sigma\langle \mathcal{F} \rangle$, then $\mathcal{M} \otimes \mathcal{N} = \sigma\langle \{E \times F : E \in \mathcal{E}, F \in \mathcal{F}\} \rangle$.

PROOF 1. $E \times F = (E \times Y) \cap (X \times F) = \pi_X^{-1}(E) \cap \pi_Y^{-1}(F)$. We see that $\{E \times F : E \in \mathcal{M}, F \in \mathcal{N}\} \subseteq \sigma\langle \pi_X^{-1}(\mathcal{M}) \cup \pi_Y^{-1}(\mathcal{N}) \rangle$ and $\pi_X^{-1}(\mathcal{M}) \cup \pi_Y^{-1}(\mathcal{N}) \subseteq \sigma\langle \{E \times F : E \in \mathcal{M}, F \in \mathcal{N}\} \rangle$.

2.

$$\begin{aligned} \mathcal{M} \otimes \mathcal{N} &= \sigma\langle \pi_X^{-1}(\mathcal{M}) \cup \pi_Y^{-1}(\mathcal{N}) \rangle \\ &= \sigma\langle \pi_X^{-1}(\mathcal{E}) \cup \pi_Y^{-1}(\mathcal{F}) \rangle \end{aligned}$$

since $\sigma\langle \pi_X^{-1}(E) \rangle = \pi_X^{-1}(\mathcal{M})$. ■

Let (X, d) be a metric space, $\mathcal{G}(X)$ denote the open sets in X , and \mathcal{B} the Borel σ -algebra. If ρ is an equivalent metric to d , then these metric generate the same open sets (and thus the same σ -algebra).

7.6 Proposition. *Let $(X, d_X), (Y, d_Y)$ be separable metric spaces, and let ρ be any metric on $X \times Y$ such that $\rho \sim \rho_\infty$ (where $\rho_\infty((x, y), (x', y')) = \max\{d_X(x, x'), d_Y(y, y')\}$). Then $\mathcal{B}(X \times Y, \rho) = \mathcal{B}(X, d_X) \otimes \mathcal{B}(Y, d_Y)$.*

PROOF For $r > 0$, $(x, y) \in X \times Y$, we have radius r open balls. Since X, Y are separable, write G as a countable union of products of open balls in X and Y . Thus $\mathcal{G}(X \times Y) \subseteq \mathcal{B}(X) \otimes \mathcal{B}(Y)$, so $\mathcal{B}(X \times Y) = \mathcal{B}(X) \times \mathcal{B}(Y)$. Conversely,

$$\begin{aligned} \mathcal{B}(X) \times \mathcal{B}(Y) &= \sigma\langle\{G \times H : G \subseteq X \text{ open}, H \subseteq Y \text{ open}\}\rangle \\ &\subseteq \sigma\langle\mathcal{G}(X \times Y)\rangle \subseteq \mathcal{B}(X \times Y) \end{aligned} \quad \blacksquare$$

Even without the separability assumption, f always holds. However, the converse inclusion is in doubt. (take (\mathbb{R}, d) where d is the discrete metric).

Also note, by induction, $\mathcal{B}(\mathbb{R}^d) = \mathcal{B}(\mathbb{R}) \otimes \cdots \otimes \mathcal{B}(\mathbb{R})$.

7.7 Proposition. *If (X, \mathcal{M}) , (Y, \mathcal{N}) and (Z, \mathcal{O}) are measurable spaces, $S : X \rightarrow Y$ and $T : Y \rightarrow Z$ are measurable, then $T \circ S : X \rightarrow Z$ is measurable.*

PROOF If $E \in \mathcal{O}$, then $(T \circ S)^{-1}(E) = S^{-1}(T^{-1}(E)) \in \mathcal{M}$. ■

7.8 Proposition. *If (X, \mathcal{M}) is a measurable space, and $T : X \rightarrow \mathbb{R}^d$, then T is $\mathcal{M} - \mathcal{B}(\mathbb{R})$ -measurable if and only if each $\pi_k \circ T : X \rightarrow \mathbb{R}$ is \mathcal{M} -measurable.*

PROOF If $B \in \mathcal{B}(\mathbb{R})$, then $(\pi_k \circ T)^{-1}(B) = T^{-1}(\pi_k^{-1}(B))$. Let's refer to this by $(*)$.

(\Rightarrow) We have that $\pi_k : \mathbb{R}^d \rightarrow \mathbb{R}$ is continuous, so $\pi_k^{-1}(G)$ is open for open G in \mathbb{R} , and hence $\pi_k^{-1}(B) \in \mathcal{B}(\mathbb{R}^d)$ for B above. Hence $T^{-1}(\pi_k^{-1}(B)) \in \mathcal{M}$ by $(*)$

(\Leftarrow) We have $(\pi_k \circ T)^{-1}(B) \in \mathcal{M}$ for B above. We have that $\mathcal{B}(\mathbb{R}^d) = \sigma\langle\pi_1^{-1}(\mathcal{B}(\mathbb{R})) \cup \cdots \cup \pi_n^{-1}(\mathcal{B}(\mathbb{R}))\rangle$. Then by $(*)$, we see that T is $\mathcal{M} - \mathcal{B}(\mathbb{R}^d)$ -measurable. ■

7.9 Corollary. $\mathbb{C} \cong \mathbb{R}^2$ and if (X, \mathcal{M}) is a measurable space, $T : X \rightarrow \mathbb{C}$, then T is $\mathcal{M} - \mathcal{B}(\mathbb{C})$ -measurable if and only if $\text{Re}(T), \text{Im}(T) : X \rightarrow \mathbb{R}$ is \mathcal{M} -measurable.

Definition. We call an $\mathcal{M} - \mathcal{B}(\mathbb{C})$ -measurable function an \mathcal{M} -measurable function.

7.10 Corollary. *Arithmetic property of measurable functions. Let (X, \mathcal{M}) be a measurable space; $f, g : X \rightarrow \mathbb{C}$ each be measurable. Then $f + g, fg : X \rightarrow \mathbb{C}$ are each \mathcal{M} -measurable.*

PROOF Consider $\alpha : \mathbb{C}^2 \rightarrow \mathbb{C}$, $m : \mathbb{C}^2 \rightarrow \mathbb{C}$ given by $\alpha(z, w) = z + 2$, $m(z, w) = zw$ are continuous functions and thus $\mathcal{B}(\mathbb{C}^2) - \mathcal{B}(\mathbb{C})$ -measurable. We define $F : X \rightarrow \mathbb{C}^2$ by $F(x) = (f(x), g(x))$. By a modification of the last proposition, \mathbb{C}^2 playing the role of \mathbb{R}^d , we see that F is $\mathcal{M} - \mathcal{B}(\mathbb{C})$ -measurable. Then $f + g = \alpha \circ F$, $fg = m \circ F$. ■

8 INTEGRATION

Definition. If (X, \mathcal{M}) is a measurable space, let $\mathcal{S}^+(X, \mathcal{M}) = \{\phi : X \rightarrow [0, \infty) : |\phi(x)| < \infty, \phi \text{ is measurable}\}$.

8.1 Lemma. (i) If $E \in \mathcal{P}(X)$, then $1_E \in \mathcal{S}^+(X, \mathcal{M})$ if and only if $E \in \mathcal{M}$.

(ii) If $\phi : X \rightarrow [0, \infty)$ then $\phi \in \mathcal{S}^+(X, \mathcal{M})$ if and only if there are $0 \leq a_1 < a_2 < \dots < a_n$, $E_1, \dots, E_n \in \mathcal{M}$ pairwise disjoint, so that $\phi = \sum_{i=1}^n a_i 1_{E_i}$.

PROOF (i) Clearly $1_E(X) \subseteq [0, \infty)$. If $B \in \mathcal{B}(\mathbb{R})$, then

$$1_E^{-1}(B) = \begin{cases} \emptyset & : \{0, 1\} \cap B = \emptyset \\ E & : \{0, 1\} \cap B = \{1\} \\ X \setminus E & : \{0, 1\} \cap B = \{0\} \\ X & : \{0, 1\} \subseteq B \end{cases}$$

(ii) (\Leftarrow). Use (i) and arithmetic of measurable functions.

(\Rightarrow) Let $\{a_1, \dots, a_n\} = \phi(X)$. Then let $E_i = \phi^{-1}(\{a_i\})$. ■

Definition. If (X, \mathcal{M}, μ) is a measure space, define $I_\mu : \mathcal{S}^+(X, \mathcal{M}) \rightarrow [0, \infty]$ by $I_\mu(\phi) = \sum_{i=1}^n a_i \mu(E_i)$ where ϕ is in standard form. Here, we say $a \cdot \infty = \infty$ if $a \neq 0$, and $0 \cdot \infty = 0$.

8.2 Proposition. Let $\phi, \psi \in \mathcal{S}^+(X, \mathcal{M})$. Then

(i) If $\phi \leq \psi$ (pointwise), then $I_\mu(\phi) \leq I_\mu(\psi)$.

(ii) If $c \in [0, \infty)$, then $I_\mu(\phi + c\psi) = I_\mu(\phi) + cI_\mu(\psi)$.

PROOF Write $\phi = \sum_{i=1}^n a_i 1_{E_i}$, $\psi = \sum_{j=1}^m b_j 1_{F_j}$ in standard forms.

(i)

$$\begin{aligned} I_\mu(\phi) &= \sum_{i=1}^n a_i \mu(E_i) \\ &= \sum_{i=1}^n a_i \sum_{j=1}^m \mu(E_i \cap F_j) \\ &= \sum_{j=1}^m \sum_{i=1}^n a_i \mu(E_i \cap F_j) \\ &\leq \sum_{j=1}^m \sum_{i=1}^n b_i \mu(E_i \cap F_j) \\ &= \sum_{j=1}^m b_j \mu(F_j) = I_\mu(\psi) \end{aligned}$$

(ii) Notice that $1_E 1_F = 1_{E \cap F}$. We have

$$\begin{aligned} \phi + c\psi &= \sum_{j=1}^m 1_{F_j} \sum_{i=1}^n a_i 1_{E_i} + \sum_{i=1}^n 1_{E_i} \sum_{j=1}^m cb_j 1_{F_j} \\ &= \sum_{i=1}^n \sum_{j=1}^m (a_i + cb_j) 1_{E_i \cap F_j} \end{aligned}$$

Let $\{c_1, \dots, c_p\} = \{a_i + cb_j : i = 1, \dots, n; j = 1, \dots, m\}$ (distinct enumeration) and for $k = 1, \dots, p$, and $G_k = \bigcup E_i \cap F_j$ (union over appropriate indices) so $\phi + c\psi = \sum_{k=1}^p c_k 1_{G_k}$. Then

$$\begin{aligned} I_\mu(\phi + c\psi) &= \sum_{k=1}^p c_k \mu(G_k) \\ &= \sum_{i=1}^n \sum_{j=1}^m (a_i + cb_j) \mu(E_i \cap F_j) \\ &= \sum_{i=1}^n a_i \mu(E_i) + c \sum_{j=1}^m b_j \mu(F_j) \\ &= I_\mu(\phi) + c I_\mu(\psi) \end{aligned} \quad \blacksquare$$

- 8.3 Corollary.** 1. If $f, g \in \overline{M}^+(X, \mathcal{M})$, $c \geq 0$, then $f + cg \in \overline{M}^+(X, \mathcal{M})$ and $\int_X (f + cg) \mu = \int_X f \mu + c \int_X g \mu$.
2. If $(f_k)_{k=1}^\infty \subset \overline{M}^+(X, \mathcal{M})$, then $\sum_{k=1}^\infty f_k \in \overline{M}^+(X, \mathcal{M})$ and $\int_X (\sum_{k=1}^\infty f_k) \mu = \sum_{k=1}^\infty \int_X f_k \mu$.
3. If $f \in \overline{M}^+(X, \mathcal{M})$, then $\mu_f : \mathcal{M} \rightarrow [0, \infty]$, $\mu_f(E) = \int_X (1_E f) \mu$ defines a measure.

PROOF 1. Let $(\phi_n)_{n=1}^\infty \subset S_f^+$, so $\phi_1 \leq \phi_2 \leq \dots$, $\lim_{n \rightarrow \infty} \phi_n = f$ and $(\psi_n)_{n=1}^\infty \subset S_g^+$. Then $(\phi_n + c\psi_n)_{n=1}^\infty \subset S_{f+cg}^+$ with $\phi_1 + c\psi_1 \leq \phi_2 + c\psi_2 \leq \dots$ and $\lim_{n \rightarrow \infty} (\phi_n + c\psi_n) = f + cg$. Thus $f + cg \in \overline{M}^+(X, \mathcal{M})$. Furthermore, MCT provides

$$\begin{aligned} \int_X (f + cg) \mu &= \lim_{n \rightarrow \infty} \int_X (\phi_n + c\psi_n) \mu \\ &= \lim_{n \rightarrow \infty} \left(\int_X \phi_n \mu + c \int_X \psi_n \mu \right) \\ &= \lim_{n \rightarrow \infty} \int_X \phi_n \mu + c \lim_{n \rightarrow \infty} \int_X \psi_n \mu \\ &= \int_X f \mu + c \int_X g \mu \end{aligned}$$

2. Let $g_n = \sum_{k=1}^n f_k$. Then $g_1 \leq g_2 \leq \dots$ with $\sum_{k=1}^\infty f_k = \lim_{n \rightarrow \infty} g_n$. We apply (1), and by MCT, we have

$$\begin{aligned} \int_X \sum_{k=1}^\infty f_k \mu &= \int_X \lim_{n \rightarrow \infty} g_n \mu \\ &= \lim_{n \rightarrow \infty} \int_X g_n \mu \\ &= \lim_{n \rightarrow \infty} \sum_{k=1}^n \int_X f_k \mu \\ &= \sum_{k=1}^\infty \int_X f_k \mu \end{aligned}$$

3. Notice that $1_\emptyset = 0$, so $\mu_f(\emptyset) = 0$. If $E_1, E_2, \dots \in \mathcal{M}$ are disjoint, then apply (ii) to get $f_k = 1_{E_k}$, noting that $\sum_{k=1}^\infty 1_{E_k} = 1_{\bigcup_{k=1}^\infty E_k}$ to see σ -additivity. ■

INTEGRATION OF COMPLEX VALUED FUNCTIONS

Let (X, \mathcal{M}, μ) be a measure space. We let

$$\begin{aligned} M(X, \mathcal{M}) &= \{f : X \rightarrow \mathbb{C} : f \text{ is } \mathcal{M}\text{-measurable}\} \\ M^{\mathbb{R}}(X, \mathcal{M}) &= \{f : X \rightarrow \mathbb{R} : f \text{ is } \mathcal{M}\text{-measurable}\} \\ M^+(X, \mathcal{M}) &= \{f : X \rightarrow [0, \infty) : f \text{ is } \mathcal{M}\text{-measurable}\} \end{aligned}$$

Remark. 1. If $f \in M^{\mathbb{R}}(X, \mathcal{M})$, then $f^+ := \max\{f, 0\}$, $f^- := \max\{-f, 0\}$ are both in M^+ . Thus, we have $f = f^+ - f^-$ and $|f| = f^+ + f^-$.

2. If $f \in M(X, \mathcal{M})$, then $|\cdot| : \mathbb{C} \rightarrow [0, \infty)$ is continuous and thus Borel measurable.

Definition. We let $L(X, \mathcal{M}, \mu) = L(\mu) := \{f \in M(X, \mathcal{M}) : \int_X |f| d\mu < \infty\}$ denote the μ -**Lebesgue integrable** functions. Notice that $\operatorname{Re} f^+, \operatorname{Re} f^-, \operatorname{Im} f^+, \operatorname{Im} f^- \leq |f| \leq \operatorname{Re} f^+ + \dots + \operatorname{Im} f^-$, so we have $f \in L(\mu) \Leftrightarrow \operatorname{Re} f^+, \dots, \operatorname{Im} f^- \in L(\mu)$. We may therefore define for $f \in L(\mu)$ the **Lebesgue integral** with respect to μ

$$\int_X f d\mu = \int_X \operatorname{Re} f^+ d\mu - \int_X \operatorname{Re} f^- d\mu + i \left(\int_X \operatorname{Im} f^+ d\mu - \int_X \operatorname{Im} f^- d\mu \right)$$

8.4 Proposition. If $f, g \in L(X, \mathcal{M}, \mu)$ and $c \in \mathbb{C}$, then $f + g, cf \in L(\mu)$ with $\int_X (f + g) d\mu = \int_X f d\mu + \int_X g d\mu$, $\int_X (cf) d\mu = c \int_X f d\mu$.

PROOF Assume $f, g \in L^{\mathbb{R}}(\mu)$ and $c \in \mathbb{R}$. Then

$$(f + g)^+ - (f + g)^- = f + g = f^+ - f^- + g^+ - g^- \Rightarrow (f + g)^+ + f^- + g^- = f^+ + g^+ + (f + g)^-$$

We then integrate, applying the last corollary, and rearrange. Similarly, $c = cf^+ - cf^-$ if $c \geq 0$, and $|c|f^- - |c|f^+$ if $c < 0$. Then, for example, if $c < 0$, we have $\int_X |c|f^\pm d\mu = |c| \int_X f^\pm d\mu < \infty$ and $\int_X |c|f^- d\mu - \int_X |c|f^+ d\mu = |c| \int_X f^- d\mu - |c| \int_X f^+ d\mu = c \int_X f d\mu$.

Finally, use \mathbb{C} -arithmetic on $\operatorname{Re}, \operatorname{Im}$ parts. ■

Definition. If $f, g \in M(X, \mathcal{M})$, we say that $f = g$ μ -**almost everywhere** if $\mu(\{x \in X : f(x) \neq g(x)\}) = 0$.

Notice that

$$\{x \in X : f(x) \neq g(x)\} = \begin{cases} (f - g)^{-1}(\mathbb{C} \setminus \{0\}) \\ (f - g)^{-1}((0, \infty)) \cup [f^{-1}(\{\infty\}) \cap g^{-1}([0, \infty))] \cup [f^{-1}([0, \infty)) \cap g^{-1}(\{\infty\})] \end{cases}$$

If $f = g$ μ -a.e., and $g = h$ μ -a.e., then $f = h$ μ -a.e. If $(f_n)_{n=1}^\infty \subset M(X, \mathcal{M})$, we write $\lim_{n \rightarrow \infty} f_n = f$ μ -a.e. if $\mu(\{x \in X : \lim_{n \rightarrow \infty} f_n(x) \neq f(x)\}) = 0$. Notice that

$$\begin{aligned} E &= \{x \in X : \lim_{n \rightarrow \infty} f_n(x) \text{ does not exist}\} \\ &= \{x \in X : \liminf_{n \rightarrow \infty} \operatorname{Re} f_n \neq \limsup_{n \rightarrow \infty} \operatorname{Re} f_n\} \cup \{x \in X : \liminf_{n \rightarrow \infty} \operatorname{Im} f_n \neq \limsup_{n \rightarrow \infty} \operatorname{Im} f_n\} \end{aligned}$$

Likewise, $\{x \in X : \lim_{n \rightarrow \infty} f(x) \text{ exists, but is not } f(x)\} \in \mathcal{M}$.

8.5 Lemma. Let $f \in \overline{M}^+(X, \mathcal{M})$. Then

1. $\int_X f \mu < \infty \Rightarrow \mu(f^{-1}(\{\infty\})) = 0$, i.e. $f < \infty$ μ -a.e.
2. $\int_X f \mu \Leftrightarrow \mu(f^{-1}((0, \infty])) = 0$, i.e. $f = 0$ μ -a.e.

PROOF 1. For each $N \in \mathbb{N}$, $n1_{f^{-1}(\{\infty\})} \in S_f^+$, so $0 \leq n\mu(f^{-1}(\{\infty\})) \leq \int_X f \mu < \infty$, so that

$$\mu(f^{-1}(\{\infty\})) = 0.$$

2. $\frac{1}{n}1_{f^{-1}([1/n, \infty))} \in S_f^+$ so

$$0 \leq \frac{1}{n}\mu(f^{-1}([1/n, \infty))) = \int_X \frac{1}{n}1_{f^{-1}([1/n, \infty))} \leq \int_X f \mu = 0$$

so $\mu(f^{-1}([1/n, \infty))) = 0$. Now,

$$f^{-1}((0, \infty)) = \bigcup_{n=1}^{\infty} f^{-1}([1/n, \infty))$$

so the result holds by σ -subadditivity.

Conversely, let $\phi = \sum_{i=1}^n a_i 1_{E_i} \in S_f^+$ in standard form, and $a_i > 0$, then $E_i = f^{-1}(\{a_i\}) \subseteq^{-1}((0, \infty))$, so $\mu(E_i) = 0$. Thus $\int_X \phi \mu = 0$ so $\int_X f \mu = 0$. ■

8.6 Corollary. 1. If $f \in \overline{M}^+(X, \mathcal{M})$, then $\int_X f \mu < \infty$ if and only if there is $f_0 \in M^+(X, \mathcal{M})$ so that $f = f_0$ μ -a.e.

2. If $f, g \in L(X, \mathcal{M}, \mu)$, then $f = g$ μ -a.e. if and only if $\int_X |f - g| \mu = 0$.

PROOF Clear from above. ■

8.7 Theorem. Let $(f_n) \subseteq L(X, \mathcal{M}, \mu)$, and $f \in M(X, \mathcal{M})$ such that

- $\lim_{n \rightarrow \infty} f_n = f$ μ -a.e.
- There is $g \in L^+(\mu)$ such that $|f_n| \leq g$ μ -a.e. Then $f \in L(\mu)$ and $\lim_{n \rightarrow \infty} \int_X f_n \mu = \int_X f \mu$. If, further, (X, \mathcal{M}, μ) is complete, we may take $f : X \rightarrow \mathbb{C}$.

PROOF Let $N = \bigcup_{n=1}^{\infty} (|f_n| - g)^{-1}((0, \infty)) \cup \{x \in X : \lim f_n(x) \neq f(x)\}$, so $\mu(N) = 0$. Replace f_n by $1_N f_n$ and f by $1_N f$, and assume all limits and inequalities are pointwise. Notice if (X, \mathcal{M}, μ) is complete, then we do not need the assumption that f is measurable to see that $N \in \mathcal{M}$. We thus have that $f \in M(X, \mathcal{M})$ with $|f| = \lim |f_n| \leq |g|$, so $\int_X f \mu < \infty$.

(I) Assume that each f_n , hence f , is \mathbb{R} -valued. Then $(g + f_n)_{n=1}^{\infty}, (g - f_n)_{n=1}^{\infty} \subset M^+(X, \mathcal{M})$. Hence, we may use Fatou's Lemma:

$$\begin{aligned} \int_X g \mu \pm \int_X f \mu &= \int_X (g \pm f) \mu = \int_X \liminf_{n \rightarrow \infty} (g \pm f_n) \mu \\ &\leq \liminf_{n \rightarrow \infty} \int_X (g \pm f_n) \mu = \liminf_{n \rightarrow \infty} \left(\int_X g \mu \pm \int_X f_n \mu \right) \\ &= \begin{cases} \int_X g \mu + \liminf_{n \rightarrow \infty} \int_X f_n \mu & \pm = + \\ \int_X g \mu - \limsup_{n \rightarrow \infty} \int_X f_n \mu & \pm = - \end{cases} \end{aligned}$$

Then

- $\pm = +$ provides $\int_X g \mu + \int_X f \mu \leq \int_X G \mu + \liminf_{n \rightarrow \infty} \int_X f_n \mu$. Thus $\int_X f \mu \leq \liminf_{n \rightarrow \infty} \int_X f_n \mu$.
- $\pm = -$ implies $\int_X f \mu \geq \limsup_{n \rightarrow \infty} \int_X f_n \mu$.

Thus $\limsup_{n \rightarrow \infty} \int_X f_n \mu \leq \int_X f \mu \leq \liminf_{n \rightarrow \infty} \int_X f_n \mu$, so $\lim_{n \rightarrow \infty} \int_X f_n \mu$ exists and equals $\int_X f \mu$.

(II) Here we use (I) to see that $\lim_{n \rightarrow \infty} \operatorname{Re} f_n = \operatorname{Re} f$, so $\lim_{n \rightarrow \infty} \int_X \operatorname{Re} f_n \mu = \int_X \operatorname{Re} f \mu$, and likewise with imaginary parts. Thus

$$\begin{aligned} \lim_{n \rightarrow \infty} \int_X f_n \mu &= \lim_{n \rightarrow \infty} \int_X \operatorname{Re} f_n \mu + i \lim_{n \rightarrow \infty} \int_X \operatorname{Im} f_n \mu \\ &= \int_X \operatorname{Re} f \mu + i \int_X \operatorname{Im} f \mu = \int_X f \mu \end{aligned} \quad \blacksquare$$

Note that MCT and Fatou's lemma also work with assumptions of μ -a.e. convergence. Let $S(X, \mathcal{M}) = \{\phi : X \rightarrow \mathbb{C} : \phi \text{ is } \mathcal{M}\text{-measurable}, |\phi(X)| < \infty\}$.

- 8.8 Corollary.** 1. If $(f_n) \subseteq L(\mu)$, $f \in M(X, \mathcal{M})$ with $f = \lim f_n$ μ -a.e. and there is $g \in L^+(\mu)$ with $|f_n| \leq g$ μ -a.e., then $\lim_{n \rightarrow \infty} \int_X |f - f_n| \mu = 0$.
2. Given $f \in L(\mu)$, there exists a sequence $(\phi_n) \subseteq S(X, \mathcal{M})$ such that $|\phi_n| \leq |f|$ and $\lim_{n \rightarrow \infty} \phi_n = f$. Furthermore, we have that $\int_X f \mu = \lim_{n \rightarrow \infty} \int_X \phi_n \mu$.
3. If $f \in L(\mu)$, then $|\int_X f \mu| \leq \int_X |f| \mu$.

PROOF 1. We have $\lim_{n \rightarrow \infty} |f - f_n| = 0$ μ -a.e., and $|f - f_n| \leq |f| + |f_n| \leq 2g \in L^+(\mu)$. Apply L.D.C.T..

2. An earlier lemma gives us sequences $(\phi_n^+)_{n=1}^\infty, (\psi_n^+)_{n=1}^\infty$ so that $0 \leq \phi_1^+ \leq \phi_2^+ \leq \dots$ with $\lim \phi_n^+ = \operatorname{Re} f^+$, $0 \leq \psi_1^- \leq \psi_2^- \leq \dots$ with $\lim \psi_n^- = \operatorname{Im} f^-$. Let $\phi_n = \phi_n^+ - \phi_n^- + i[\psi_n^+ - \psi_n^-]$. Then

$$\begin{aligned} |\phi_n| &= [|\phi_n^+ - \phi_n^-|^2 + |\psi_n^+ - \psi_n^-|^2]^{1/2} \\ &\leq [(\phi_n^+ + \phi_n^-)^2 + (\psi_n^+ + \psi_n^-)^2]^{1/2} \leq [(\operatorname{Re} f^+ + \operatorname{Re} f^-)^2 + (\operatorname{Im} f^+ + \operatorname{Im} f^-)^2]^{1/2} \\ &= |f| \end{aligned}$$

and, also, $\lim \phi_n = f$. We have that since $|\phi_n| \leq |f|$, we use LDCT to get a limit of integrals.

3. If $\phi \in S^-(X, \mathcal{M}) \cap L(\mu)$, write $\phi = \sum_{i=1}^n c_i 1_{E_i}$. Then

$$|\int_X \phi \mu| = |\sum_{i=1}^n c_i \mu(E_i)| \leq \sum_{i=1}^n |c_i| \mu(E_i) = \int_X |\phi| \mu$$

Now, if $f \in L(\mu)$, we obtain sequences $(\phi_n)_{n=1}^\infty \subset S(X, \mathcal{M})$. Thus we have

$$|\int_X f \mu| = \lim |\int_X \phi_n \mu| \leq \lim \int_X |\phi_n| \mu = \int_X |f| \mu$$

as $|\phi_n| \leq |f|$, $\lim |\phi_n| = |f|$. \blacksquare

8.9 Lemma. Let (X, \mathcal{A}, μ_0) be a premeasure space, and (X, \mathcal{M}, μ) denote the canonical induced measure space. Given $f \in L(\mu)$, $\epsilon > 0$, there is

$$\phi = \sum_{i=1}^n a_i 1_{B_i}, a_1, \dots, a_n \in \mathbb{C}, B_1, \dots, B_n \in \mathcal{A}$$

such that $\int_X |\phi - f| \mu < \epsilon$.

PROOF (I) Let $E \in \mathcal{M}$, with $\mu(E) < \infty$. Then given $\epsilon > 0$, there is $B \in \mathcal{A}$ so that $\mu(B \Delta E) < \epsilon$. To see this, let $A_1, A_2, \dots \in \mathcal{A}$ so that $E \subseteq \bigcup_{i=1}^{\infty} A_i$ with $\sum_{i=1}^{\infty} \mu_0(A_i) < \mu^*(E) + \epsilon = \mu(E) + \epsilon$. Let n be so that $\sum_{i=n+1}^{\infty} \mu_0(A_i) < \epsilon/2$, and let $B = \bigcup_{i=1}^n A_i \in \mathcal{A}$. Then $B \Delta E \subseteq (\bigcup_{i=1}^{\infty} A_i \setminus E) \cup (\bigcup_{i=n+1}^{\infty} A_i)$ and the result follows by σ -subadditivity.

(II) If $\psi \in S(X, \mathcal{M}) \cap L(\mu)$. Then given $\epsilon > 0$, there is ϕ as above so $\int |\psi - \phi| < \epsilon$. To see this, write $\psi = \sum_{i=1}^n a_i 1_{E_i}$. By (I), we find for each i , B_i in \mathcal{A} such that $\mu(B_i \Delta E_i) < \epsilon/a$, where $a = 1 + \sum_{i=1}^n |a_i|$. Then

$$\int |\phi - \psi| \leq \sum_{i=1}^n |a_i| \int |1_{B_i} - 1_{E_i}| = \sum_{i=1}^n \mu(B_i \Delta E_i) < \epsilon$$

(III) If $f \in L(\mu)$, a corollary to LDCT provides ψ in $S(X, \mathcal{M}) \cap L(\mu)$ such that $\int |f - \psi| < \epsilon/2$. We let ϕ as in (II), so $\int |\psi - \phi| < \epsilon/2$. ■

8.10 Proposition. Let (X, \mathcal{M}, μ) be a measure space, $f : X \times (a, b) \rightarrow \mathbb{C}$ satisfy that

- $f(\cdot, s) \in L(\mu)$ for each $s \in (a, b)$
- $\frac{\partial}{\partial s} f(x, s) = \lim_{h \rightarrow 0} \frac{f(x, s+h) - f(x, s)}{h}$ exists for each (x, s) in $X \times (a, b)$
- there is $g \in L^+(\mu)$ so that $\left| \frac{\partial}{\partial s} f(\cdot, s) \right| \leq g$ μ -a.e for each $s \in (a, b)$.

Then $F(x) = \int_X f(x, s) \mu(x)$, and F is differentiable on (a, b) with $F'(s) = \int_X \frac{\partial}{\partial s} f(x, s) \mu(x)$.

PROOF We fix $s \in (a, b)$ and an arbitrary sequence $(h_n)_{n=1}^{\infty} \subset \mathbb{R} \setminus \{0\}$ such that $s + h_n \in (a, b)$ for each n , and $\lim h_n = 0$. Notice that for each $x \in X$, $f(x, \cdot) : (a, b) \rightarrow \mathbb{C}$ is continuous on intervals $[s, s + h_n]$, $[s + h_n, s]$ (if $h_n < 0$) for $n \in \mathbb{N}$. Thus, by MVT, we find $c_n, d_n \in (s, s + h_n)$ such that

$$\begin{aligned} |f(x, s + h_n) - f(x, s)| &= \left| \operatorname{Re} \frac{\partial}{\partial s} f(x, c_n) + i \operatorname{Im} \frac{\partial}{\partial s} f(x, d_n) \right| |h_n| \\ &\leq 2|g(x)| |h_n| \end{aligned}$$

Thus, by LDCT,

$$\begin{aligned} F'(s) &= \lim_{n \rightarrow \infty} \frac{F(s + h_n) - F(s)}{h_n} = \lim_{n \rightarrow \infty} \int \left(\frac{f(x, s + h_n) - f(x, s)}{h_n} \mu(x) \right) \\ &= \int \frac{\partial}{\partial s} f(x, s) \mu(x) \end{aligned} \quad \blacksquare$$

9 MODES OF CONVERGENCE

Let (X, \mathcal{M}, μ) be a measure space, $(f_n), f \in M(X, \mathcal{M})$. We say that $\lim f_n = f$

- **uniformly** if $\lim_{n \rightarrow \infty} \sup_{x \in X} |f_n(x) - f(x)| = 0$
- **pointwise** if $\lim_{n \rightarrow \infty} |f_n(x) - f(x)| = 0$ for each $x \in X$
- **pointwise μ -a.e.** if $\lim_{n \rightarrow \infty} |f_n(x) - f(x)| = 0$ for each $x \in X \setminus N$, where $\mu(N) = 0$.
- **in $L^1(\mu)$** if $\lim_{n \rightarrow \infty} \int_X |f_n - f| d\mu = 0$.
- **in μ -measure** if for any $\epsilon > 0$ we have $\lim_{n \rightarrow \infty} \mu(\{x \in X : |f_n(x) - f(x)| \geq \epsilon\}) = 0$.

Example. Consider sequences $f_n = \frac{1}{n} 1_{[0, n]}$, $g_n = 1_{[n, n+1]}$, $h_n = n 1_{[0, 1/n]}$, $k_n = 1_{[j/2^k, (j+1)/2^k]}$ where $n = 2^k + j$ for $j = 0, \dots, 2^k - 1$. Then

	uniform	pointwise	pointwise λ -a.e.	in $L^1(\lambda)$	in λ -measure
f_n	✓	✓	✓	×	✓
g_n	×	✓	✓	×	×
h_n	×	×	✓	×	✓
k_n	×	×	×	✓	✓

9.1 Proposition. If $\lim_{n \rightarrow \infty} f_n = f$ in $L^1(\mu)$, then $\lim_{n \rightarrow \infty} f_n = f$ in μ -measure.

PROOF Let $\epsilon > 0$, and set $E_n = \{x \in X : |f_n(x) - f(x)| \geq \epsilon\}$. Then $\int_X |f_n - f| d\mu \geq \int_{E_n} |f_n - f| d\mu \geq \int_{E_n} \epsilon = \epsilon \mu(E_n)$. Thus $\mu(E_n) \leq \frac{1}{\epsilon} \int_X |f_n - f| d\mu \rightarrow 0$ as n goes to infinity. ■

9.2 Theorem. Let $(f_n)_{n=1}^\infty, f \in M(X, \mathcal{M})$. Then

- (i) If $\lim_{n \rightarrow \infty} f_n = f$ in μ -measure, then $(f_n)_{n=1}^\infty$ is **Cauchy in μ -measure**; i.e., given $\epsilon, \delta > 0$, there is $n_0 \in \mathbb{N}$ (dependent on ϵ, δ) such that whenever $n, m \geq n_0$, $\mu(\{x \in X : |f_n(x) - f_m(x)| \geq \epsilon\}) < \delta$.
- (ii) If $(f_n)_{n=1}^\infty$ is Cauchy in μ -measure, then there is a subsequence $(f_{n_j})_{j=1}^\infty$ such that $\lim_{j \rightarrow \infty} f_{n_j} = f_0$ for some $f_0 \in M(X, \mathcal{M})$ μ -a.e. Furthermore, $\lim_{j \rightarrow \infty} f_{n_j} = f_0$ in measure.

PROOF (i) If $m, n \in \mathbb{N}$, then

$$\begin{aligned} \{x \in X : |f_n(x) - f_m(x)| \geq \epsilon\} &\subseteq \{x \in X : |f_n(x) - f(x)| + |f(x) - f_m(x)| \geq \epsilon\} \\ &\subseteq \{x \in X : |f_n(x) - f(x)| \geq \epsilon/2\} \cup \{x \in X : |f(x) - f_m(x)| \geq \epsilon/2\} \end{aligned}$$

and apply definitions.

- (ii) Let $n_1 < n_2 < \dots$ be such that $E_j = \{x \in X : |f_{n_j}(x) - f_{n_{j+1}}(x)| \geq 1/2^j, n, m \geq n_j\}$ satisfies $\mu(E_j) < 1/2^j$ (i.e. $\epsilon, \delta = 1/2^j$). Let $F_k = \bigcup_{j=k}^\infty E_j$, so by σ -subadditivity, $\mu(F_k) \leq 1/2^{k-1}$. If $x \notin F_k$, then for $i > j \geq k$, we have

$$\begin{aligned} |f_{n_j}(x) - f_{n_i}(x)| &\leq \sum_{p=j}^{i-1} |f_{n_p}(x) - f_{n_{p+1}}(x)| \\ &< \sum_{p=j}^{i-1} \frac{1}{2^p} \\ &= \frac{1}{2^{j-1}} \leq \frac{1}{2^{k-1}} \end{aligned}$$

Thus $(f_{n_j})_{j=1}^\infty$ is pointwise Cauchy on $X \setminus F_k$. Let $F = \bigcap_{k=1}^\infty F_k$, so

$$0 \leq \mu(F) \leq \mu(F_k) \leq \frac{1}{2^{k-1}}$$

and since this holds for any k , $\mu(F) = 0$. Thus for $x \in X \setminus F = \bigcup_{k=1}^\infty (X \setminus F_k)$, we have that $(f_{n_j})_{j=1}^\infty$ is pointwise Cauchy. Thus there is $\tilde{f} \in M(X \setminus F, \mathcal{M}|_{X \setminus F})$, so $\lim_{j \rightarrow \infty} f_{n_j} = \tilde{f}$ on $X \setminus F$. Then $f : X \rightarrow \mathbb{C}$ defined $f(x) = \tilde{f}(x)$ on $X \setminus F$ and $f(x) = 0$ otherwise. It is easy to see that $f_0 \in \mathcal{M}(X, \mathcal{M})$.

Given $\epsilon > 0$, let k be so $1/2^{k-1} < \epsilon$. Then for $x \in X \setminus F_k$, $|f_0(x) - f_{n_k}(x)| = \lim_{j \rightarrow \infty} |f_{n_j}(x) - f_{n_k}(x)| \leq \frac{1}{2^{k-1}} < \epsilon$. Thus $\{x \in X : |f_0(x) - f_{n_k}(x)| \geq \epsilon\} \subseteq F_k$, so $\mu(E) \leq \mu(F_k) \leq 1/2^{k-1} < \epsilon$. ■

9.3 Corollary. *If $\lim_{n \rightarrow \infty} f_n = f$ in $L^1(\mu)$, then there is a subsequence $(f_{n_j})_{j=1}^\infty$ such that $\lim_{j \rightarrow \infty} f_{n_j} = f$ μ -a.e.*

PROOF By the last proposition, we have $\lim f_n = f$ in μ -measure, and hence by the Theorem (i), $(f_n)_{n=1}^\infty$ is Cauchy in μ -measure. By (ii), there is a subsequence so that $\lim f_{n_j} = f_0$ μ -a.e. As before,

$$E = \{x \in X : |f_0(x) - f(x)| \geq \epsilon\} \subseteq \{x \in X : |f_n(x) - f(x)| \geq \epsilon/2\} \cup \{x \in X : |f(x) - f_m(x)| \geq \epsilon/2\}$$

and since $\lim f_n = f$ in measure and $\lim f_{n_j} = f_0$ in measure, we see that $\mu(E)$ is bounded by arbitrarily small values. ■

9.4 Corollary. *If $a < b$ in \mathbb{R} $f : [a, b] \rightarrow \mathbb{R}$ is Riemann integrable, then $f \in L([a, b], \mathcal{B}([a, b]), \lambda)$ and the Riemann and Lebesgue integral agree.*

PROOF Let

$$J_{n,i} = \left[a + \frac{i-1}{n}(b-a), a + \frac{i}{n}(b-a) \right)$$

for $i = 1, \dots, n$, $I_{n,i} = \overline{J_{n,i}}$, $l_{n,i} = \int_{x \in I_{n,i}} f(x)$, $u_{n,i} = \sup_{x \in I_{n,i}} f(x)$, $\phi_n = \sum_{i=1}^n l_{n,i} 1_{J_{n,i}}$, $\psi_n = \sum_{i=1}^n u_{n,i} 1_{J_{n,i}}$ and

$$L_n(f) = \int_{[a,b]} \phi_n \lambda, U_n(f) = \int_{[a,b]} \psi_n \lambda$$

Riemann integrability tells us that $\lim_{n \rightarrow \infty} (U_n(f) - L_n(f)) = 0$. Note that $\phi_n \leq f \leq \psi_n$, and $\int_{[a,b]} |\psi_n - \phi_n| \lambda = U_n(f) - L_n(f) \rightarrow 0$ as $n \rightarrow \infty$. Thus $\lim_{n \rightarrow \infty} |\psi_n - \phi_n| = 0$ in $L^1(\mu)$. Thus, there is a subsequence so $\lim_{j \rightarrow \infty} |\psi_{n_j} - \phi_{n_j}| = 0$ λ -a.e. Since $\phi_n \leq \phi_{n+1} \leq f \leq \psi_{n+1} \leq \psi_n$, we conclude that $f = \lim \phi_{n_j}$ λ -a.e. with integrable majorant $g = |\phi_1| + |\psi_1|$, so $\int_{[a,b]} f \lambda = \lim_{j \rightarrow \infty} L_{n_j}(f) = \int_a^b f$. ■

More generally, Riemann integrable functions are continuous λ -a.e. If $a < b$ in $\overline{\mathbb{R}}$, $f \geq 0$ improperly Riemann integrable, then it is Lebesgue integrable on (a, b) .

Definition. If $(f_n)_{n=1}^\infty, f$ are in $M(X, \mathcal{M})$, then $\lim f_n = f$ μ -almost uniformly if, given any $\epsilon > 0$, there is $E \in \mathcal{M}$ with $\mu(E) < \epsilon$ so that $\lim_{n \rightarrow \infty} \sup_{x \in X \setminus E} |f_n(x) - f(x)| = 0$.

9.5 Theorem. (Egoroff) Suppose (X, \mathcal{M}, μ) is a finite measure space. If $(f_n)_{n=1}^\infty, f$ are in $M(X, \mathcal{M})$ such that $\lim f_n = f$ μ -a.e., then $\lim f_n = f$ μ -almost uniformly.

Note that finiteness is essential.

PROOF Let $N = \{x \in X : \lim f_n(x) \text{ does not exist, or is not equal to } f(x)\}$, so $\mu(N) = 0$. For $k, n \in \mathbb{N}$, let $E_{n,k} = \bigcup_{m=n}^\infty \{x \in X : |f_m(x) - f(x)| \geq 1/k\}$, so $E_{n,k} \in \mathcal{M}$, $E_{n,k} \supseteq E_{n+1,k}$ and $\bigcap_{n=1}^\infty E_{n,k} \subseteq N$. Thus by continuity from above (we assume $\mu(X) < \infty$), we see that $\lim_{n \rightarrow \infty} \mu(E_{n,k}) = 0$.

Given $\epsilon > 0$, let n_k so that $\mu(E_{n_k,k}) < \epsilon/2^k$. Let $E = \bigcup_{k=1}^\infty E_{n_k,k}$ so $\mu(E) < \epsilon$ and for $x \in X \setminus E = \bigcap_{k=1}^\infty (E \setminus E_{n_k,k}) \subseteq E_{n_k,k}$, for any k , we have $|f_n(x) - f(x)| < 1/k$ for $n \geq n_k$. Thus $\limsup_{n \rightarrow \infty} \sup_{x \in X \setminus E} |f_n(x) - f(x)| \leq 1/k$, which gives $\lim_{n \rightarrow \infty} \sup_{x \in X \setminus E} |f_n(x) - f(x)| = 0$. ■

III. Product Measures

Let $(X, \mathcal{M}, \mu), (Y, \mathcal{N}, \nu)$ be two measure spaces.

9.6 Proposition. Let $\mathcal{E} = \{E \times F : E \in \mathcal{M}, F \in \mathcal{N}\} \subseteq \mathcal{P}(X \times Y)$, and let $\mathcal{A} = \langle \mathcal{E} \rangle$. Then

1. Each element of \mathcal{A} is of the form $A = \bigcup_{i=1}^n E_i \times F_i$ for $E_i \in \mathcal{M}, F_i \in \mathcal{N}, (E_i \times F_i) \cap (E_j \times F_j) = \emptyset$ if $i \neq j$.
2. We define $(\mu \times \nu)_0 : \mathcal{A} \rightarrow [0, \infty]$ by

$$(\mu \times \nu)_0(A) = \sum_{i=1}^n \mu(E_i) \nu(F_i)$$

if A is as in (i). Then $(\mu \times \nu)_0$ is a pre-measure, hence extends to a measure $\mu \times \nu : \mathcal{M} \otimes \mathcal{N} \rightarrow [0, \infty]$. If each of μ and ν are σ -finite, $\mu \times \nu$ is σ -finite and this extension is unique.

PROOF 1. We see that \mathcal{E} is an elementary family of sets: if $E, E_1 \in \mathcal{M}, F, F_1 \in \mathcal{N}$, then

- $(E \times F) \cap (E_1 \times F_1) = (E \cap E_1) \times (F \cap F_1) \in \mathcal{E}$
- $(X \times Y) \setminus (E \times F) = [(X \setminus E) \times Y] \cup [E \times (Y \setminus F)] \cup [(X \setminus E) \times (Y \setminus F)]$.

Thus the result follows from an earlier lemma.

2. We need to establish that the formula for $(\mu \times \nu)_0(A)$ is well-defined. Suppose

$$A = \bigcup_{i=1}^n (E_i \times F_i) = \bigcup_{j=1}^m (M_j \times N_j)$$

Then for each $x \in X$ we see that $1_A(x, \cdot) = \sum_{i=1}^n 1_{E_i}(x) 1_{F_i} = \sum_{j=1}^m 1_{M_j}(x) 1_{N_j}$ and hence

$$\int_Y 1_A(x, y) \nu(y) dy = \sum_{i=1}^n \nu(F_i) 1_{E_i}(x) = \sum_{j=1}^m \nu(N_j) 1_{M_j}(x)$$

and moreover

$$\begin{aligned} \int_X \left[\int_Y 1_A(x, y) \nu(y) dy \right] \mu(x) dx &= \sum_{i=1}^n \mu(E_i) \nu(F_i) \\ &= \sum_{j=1}^m \mu(M_j) \nu(N_j) \end{aligned} \tag{†}$$

which gives an unambiguous value for $(\mu \times \nu)_0(A)$. Evidently, $\emptyset = \emptyset \times \emptyset$, so $(\mu \times \nu)_0(\emptyset) = 0$. Now suppose $A, (A_n)_{n=1}^\infty$ are in \mathcal{A} , with $A = \bigcup_{n=1}^\infty A_n$. But then $1_A = \sum_{n=1}^\infty 1_{A_n}$ and for

$x \in X$, $1_A(x, \cdot) = \sum_{n=1}^{\infty} 1_{A_n}(x, \cdot)$. Thus, by 2 applications of (a Corollary to) MCT and (†),

$$\begin{aligned} (\mu \times \nu)_0(A) &= \int_X \int_Y 1_A(x, y) \nu(y) \mu(x) \\ &= \int_X \int_Y \sum_{n=1}^{\infty} 1_{A_n}(x, y) \nu(y) \mu(x) \\ &= \int_X \left[\sum_{n=1}^{\infty} \int_Y 1_{A_n}(x, y) \nu(y) \right] \mu(x) \\ &= \sum_{n=1}^{\infty} \int_X \int_Y 1_{A_n}(x, y) \nu(y) \mu(x) \\ &= \sum_{n=1}^{\infty} (\mu \times \nu)_0(A_n) \end{aligned}$$

We appeal to the canonical measure construction to get $\mu \times \nu$ on $\mathcal{M} \otimes \mathcal{N} = \sigma\langle \mathcal{E} \rangle = \sigma\langle \mathcal{A} \rangle$. If $(X_n)_{n=1}^{\infty} \subseteq \mathcal{M}$, $(Y_n)_{n=1}^{\infty} \subseteq \mathcal{N}$ show σ -finitenes of μ , (resp. ν), then each $(\mu \times \nu)(X_n \times Y_n) = \mu(X_n) \nu(Y_n) < \infty$ and $X \times Y = \bigcup_{n=1}^{\infty} X_n \times Y_n$, showing σ -finiteness of $\mu \times \nu$. ■

9.7 Theorem. Let (X, \mathcal{M}, μ) , (Y, \mathcal{N}, ν) be σ -finite measure spaces. If $E \in \mathcal{M} \otimes \mathcal{N}$, then

- (i) $x \mapsto \nu(E_x) : X \rightarrow [0, \infty]$ is \mathcal{M} -measurable
- (ii) $y \mapsto \mu(E^y) : Y \rightarrow [0, \infty]$ is \mathcal{N} -measurable.
- (iii) $\mu \times \nu(E) = \int_Y \mu(E^y) \nu(y) = \int_X \nu(E_x) \mu(x)$.

PROOF (I) We assume that $\mu(X), \mu(Y) < \infty$. Set \mathcal{C} be the set of $E \in \mathcal{M} \otimes \mathcal{N}$ for which (i), (ii), (iii) hold. We will establish that $\mathcal{A} = \langle \{M \otimes N : M \in \mathcal{M}, N \in \mathcal{N}\} \rangle \subseteq \mathcal{C}$ and that \mathcal{C} is a monotone class. Hence, the Monotone Class lemma show that $\mathcal{M} \otimes \mathcal{N} = \sigma\langle \mathcal{A} \rangle = \mathcal{C}(\mathcal{A}) \subseteq \mathcal{C} \subseteq \mathcal{M} \otimes \mathcal{N}$. If $E \in \mathcal{A}$, write $E = \bigcup_{i=1}^n A_i \times B_i$, $A_i \in \mathcal{M}$, $B_i \in \mathcal{N}$ for $i = 1, \dots, n$. Then or $x \in X$, we have

$$E_x = \bigcup_{i=1}^n B_i \implies \nu(E_x) = \sum_{i=1}^n \nu(B_i) 1_{A_i}(x)$$

Thus it is clear that (i) and part of (iii) hold or E . In the same way, (ii) holds, and the other part of (iii), so $E \in \mathcal{C}$, so $\mathcal{A} \subseteq \mathcal{C}$.

Let's see that \mathcal{C} is a monotone class. Let $E_1 \supseteq E_2 \supseteq \dots$ in \mathcal{C} . Then, for $x \in X$, $E_{1x} \supseteq E_{2x} \supseteq \dots$ in \mathcal{N} , and $(\bigcap_{n=1}^{\infty} E_n)_x = \bigcap_{n=1}^{\infty} (E_{nx})$. Since $\nu(E_{1x}) \leq \nu(X) < \infty$, we may appeal to continuity from above to see that

$$\nu\left(\left(\bigcap_{n=1}^{\infty} E_n\right)_x\right) = \nu\left(\bigcap_{n=1}^{\infty} (E_{nx})\right) = \lim_{n \rightarrow \infty} \nu(E_{nx})$$

and hence (i) holds for $\bigcap_{n=1}^{\infty} E_n$. Furthermore, by LDCT with integrable majorant $\mu(X)\nu(Y)1_{X \times Y}$ and again by continuity from above,

$$\begin{aligned} (\mu \times \nu)\left(\bigcap_{n=1}^{\infty} E_n\right) &= \lim_{n \rightarrow \infty} (\mu \times \nu)(E_n) \\ &= \lim_{n \rightarrow \infty} \int_X \nu(E_{nx}) \mu(x) \\ &= \int_X \lim_{n \rightarrow \infty} \nu(E_{nx}) \mu(x) \\ &= \int_X \nu\left(\left(\bigcap_{n=1}^{\infty} E_n\right)_x\right) \mu(x) \end{aligned}$$

so $\bigcap_{n=1}^{\infty}$ satisfies part of (iii). Likewise, if $E_1 \subseteq E_2 \subseteq \dots$ in \mathcal{C} , we may apply continuity from below, and MCT to see that $\bigcup_{n=1}^{\infty} E_n$ satisfies (i) and part of (iii). Similarly, in each case above, then y -sections of intersections of decreasing sequences or unions of increasing sequences are in \mathcal{C} .

(II) Now let each of μ, ν be σ -finite. Hence there are $X_1 \subseteq X_2 \subseteq \dots$ in \mathcal{M} , so $\bigcup_{n=1}^{\infty} X_n = X$, and $Y_1 \subseteq Y_2 \subseteq \dots$ in \mathcal{N} so $\bigcup_{n=1}^{\infty} Y_n = Y$. If $E \in \mathcal{M} \otimes \mathcal{N}$, then $E \cap (X_1 \times Y_1) \subseteq E \cap (X_2 \times Y_2) \subseteq \dots$ and each $E \cap (X_n \times Y_n)$ satisfies (i), (ii), and (iii) in the finite measure space $(\mu \times \nu)|_{X_n \times Y_n}$. Hence, we conclude by continuity from below

$$y \mapsto \mu(E^Y) = \lim_{n \rightarrow \infty} \mu(E^Y \cap Y_n)$$

since $(E \cap (X_n \times Y_n))^Y = E^Y \cap Y_n$ is an increasing sequence and this function is \mathcal{N} -measurable. Thus, by MCT and again by continuity from below,

$$\begin{aligned} \mu \times \nu(E) &= \lim_{n \rightarrow \infty} \mu(E \cap (X_n \times Y_n)) \\ &= \lim_{n \rightarrow \infty} \int_Y \nu(E^Y \cap Y_n) \nu(y) \\ &= \int_Y \lim_{n \rightarrow \infty} \nu(E^Y \cap Y_n) \nu(y) \\ &= \int_Y \nu(E^Y) \nu(y) \end{aligned}$$

Thus, E satisfies (ii) and part of (iii). Likewise, E satisfies (i) and the other part of (iii). ■

9.8 Theorem. (Tonelli and Fubini) Let (X, \mathcal{M}, μ) (Y, \mathcal{N}, ν) be σ -finite measure spaces.

(Tonelli's Theorem) If $f \in \overline{M}^+(X \times Y, \mathcal{M} \otimes \mathcal{N})$, then

$$x \mapsto \int_Y f_x \nu : X \rightarrow [0, \infty] \text{ is } \mathcal{M}\text{-measurable.}$$

$$y \mapsto \int_X f^y \mu : Y \rightarrow [0, \infty] \text{ is } \mathcal{N}\text{-measurable.}$$

and

$$\int_Y \int_X f^y \mu \nu(y) = \int_{X \times Y} f \mu \times \nu = \int_X \int_Y f_x \nu \mu(x) \quad (\dagger)$$

(Fubini's Theorem) If $f \in L(\mu \times \nu)$, then

$$\begin{aligned} \left(x \mapsto \int_Y f_x \nu \right) &\in L(\mu) \\ \left(y \mapsto \int_X f^y \mu \right) &\in L(\nu) \end{aligned}$$

and (\dagger) holds.

PROOF For an indicator function, we have

$$\begin{aligned} \int_{X \times Y} 1_E \mu \times \nu &= \mu \times \nu(E) = \int_X \nu(E_x) \mu(x) \\ &= \int_X \int_Y 1_{E_x} \nu \mu(x) \\ &= \int_X \int_Y (1_E)_x \nu \mu(x) \end{aligned}$$

Similarly, this is true for the y -sections and the other iterated integral. Hence Tonelli holds for $f \in S^+(X \times Y, \mathcal{M} \otimes \mathcal{N})$.

If $f \in \mathcal{M}^+(X \times Y, \mathcal{M} \otimes \mathcal{N})$, we have $(\phi_n)_{n=1}^\infty \subset S^+(X \times Y, \mathcal{M} \otimes \mathcal{N})$ such that $\lim \phi_n = f$. We use MCT.

- $\int_Y f_x \nu = \int_Y \lim_{n \rightarrow \infty} \phi_{nx} \nu = \lim_{n \rightarrow \infty} \int_Y \phi_{nx} \nu$, so $x \mapsto \int_Y f_x \nu$ is \mathcal{M} -measurable, and
-

$$\begin{aligned} \int_{X \times Y} f \mu \times \nu &= \lim_{n \rightarrow \infty} \int_{X \times Y} \phi_n \mu \times \nu \\ &= \lim_{n \rightarrow \infty} \int_X \int_Y \phi_{nx} \nu \mu(x) \\ &= \int_X \lim_{n \rightarrow \infty} \int_Y \phi_{nx} \nu \mu(x) \\ &= \int_X \int_Y \lim_{n \rightarrow \infty} \phi_{nx} \nu \mu(x) \\ &= \int_X \int_Y f_x \nu \mu(x) \end{aligned}$$

and the same holds for y -sections, and Tonelli's Theorem holds.

For Fubini's Theorem, we proceed as above. Recall that if $f \in L(\mu \times \nu)$, we can find $(\phi_n)_{n=1}^\infty \subset S(X \times Y, \mathcal{M} \otimes \mathcal{N})$ such that each $|\phi_n| \leq f$ and $\lim_{n \rightarrow \infty} \phi_n = f$. We use LDCT with integrable majorants to see that

$$\int_{X \times Y} |f| \mu \times \nu = \int_X \int_Y |f|_x \nu \mu(x)$$

so that $x \mapsto \left| \int_Y f_x \nu \right| \leq \int_Y |f_x| \nu$, which shows that $x \mapsto \int_Y f_x \nu$ is in $L(\mu)$. Likewise for the other section. \blacksquare

Remark. If $f \in M(X \times Y, \mathcal{M} \otimes \mathcal{N})$, we may wish to see that $f \in L(\mu \times \nu)$. This is equivalent to saying that $|f| \in L(\mu \times \nu)$, and we may be able to compute this with an iterated integral, using Tonelli's Theorem.

10 MULTIDIMENSIONAL LEBESGUE MEASURE

Let $\mathcal{B}(\mathbb{R}), \mathcal{L} \subseteq \mathcal{P}(\mathbb{R})$ denote the Borel and Lebesgue σ -algebras. Recall that the Lebesgue measure is translation invariant.

Remark. If $x, c \in \mathbb{R}, c \neq 0$, then the maps $T_x : \mathbb{R} \rightarrow \mathbb{R}$ by $y \mapsto x + y$ and $M_c : \mathbb{R} \rightarrow \mathbb{R}$ by $y \mapsto cy$ are continuous, hence Borel measurable. Thus if $E \in \mathcal{B}(\mathbb{R})$, $x + E = T_x(E) = T_x^{-1}(E) \in \mathcal{B}(\mathbb{R})$. Similarly, $cE = M_c^{-1}(E) \in \mathcal{B}(\mathbb{R})$.

10.1 Proposition. Let $f \in L(\mathbb{R}, \mathcal{B}(\mathbb{R}), \lambda) = L(\lambda)$.

(i) For $x \in \mathbb{R}$, $f \circ T_x \in L(\lambda)$ with $\int_{\mathbb{R}} f \circ T_x \lambda = \int_{\mathbb{R}} f \lambda$.

(ii) For $0 \neq c \in \mathbb{R}$, $f \circ M_c \in L(\lambda)$ with $\int_{\mathbb{R}} f \circ M_c \lambda = \frac{1}{|c|} \int_{\mathbb{R}} f \lambda$.

PROOF This is a direct application of A2 Q3(b). ■

Now, recall that $\mathcal{B}(\mathbb{R}^d) = \mathcal{B}(\mathbb{R}) \otimes \cdots \otimes \mathcal{B}(\mathbb{R})$. Let $\lambda_d = \lambda \times \cdots \times \lambda : \mathcal{B}(\mathbb{R}^d) \rightarrow [0, \infty]$ denote the d -dimensional Lebesgue measure. We define \mathcal{L}_d to be the completion of $(\mathbb{R}^d, \mathcal{B}(\mathbb{R}^d), \lambda_d)$.

Remark. For suitable f , we say

$$\int_{\mathbb{R}^d} f \lambda_d = \int_{\mathbb{R}^d} f(x_1, \dots, x_d) (x_1, \dots, x_d)$$

Fubini-Tonelli theorem tells us that

$$\int_{\mathbb{R}^d} f \lambda_d = \int_{\mathbb{R}} \cdots \int_{\mathbb{R}} f(x_1, \dots, x_d) dx_{\sigma(1)} \cdots dx_{\sigma(d)}$$

where $\sigma : [d] \rightarrow [d]$ is any bijection.

10.2 Proposition. Let $f \in L(\mathbb{R}^d, \mathcal{B}(\mathbb{R}^d), \lambda_d) = L(\lambda_d)$.

(i) For $x \in \mathbb{R}^d$, let $T_x : \mathbb{R}^d \rightarrow \mathbb{R}^d$ be given by $T_x(y) = x + y$. Then $f \circ T_x \in L(\lambda)$ with

$$\int_{\mathbb{R}^d} f \circ T_x \lambda_d = \int_{\mathbb{R}^d} f \lambda_d$$

(ii) For $A \in GL(d, \mathbb{R})$, $f \circ A \in L(\lambda)$ with

$$\int_{\mathbb{R}^d} f \circ A \lambda_d = \frac{1}{|\det A|} \int_{\mathbb{R}^d} f \lambda_d$$

PROOF (i) This follows from the previous proposition as well as Fubini-Tonelli:

$$\begin{aligned} \int_{\mathbb{R}^d} f \circ T_x \lambda_d &= \int_{\mathbb{R}} \cdots \int_{\mathbb{R}} f(x_1 + y_1, \dots, x_d + y_d) \lambda_1 \cdots \lambda_d \\ &= \int_{\mathbb{R}} \cdots \int_{\mathbb{R}} f(x_1, \dots, x_d + y_d) \lambda_1 \cdots \lambda_d \\ &\vdots \\ &= \int_{\mathbb{R}} \cdots \int_{\mathbb{R}} f(x_1, \dots, x_d) \lambda_1 \cdots \lambda_d \\ &= \int_{\mathbb{R}^d} f \lambda_d \end{aligned}$$

(ii) We can factor $A = A_1 \cdots A_n$ where each A_i is one of the following 3 types:

- (add row to vector) $A_{ij}(x_1, \dots, x_d) = (x_1, \dots, x_i + x_j, \dots, x_d)$.
- (swap) $S_{ij}(x_1, \dots, x_d) = (x_1, \dots, x_j, \dots, x_i, \dots, x_d)$
- (multiply row) $M_{ic}(x_1, \dots, x_d) = (x_1, \dots, cx_i, \dots, x_d)$

Notice that $\det(A_{ij}) = 1 = |\det S_{ij}|$, while $|\det(M_{ic})| = |c|$. If $f \geq 0$, we have for $i < j$

$$\int_{\mathbb{R}^d} f \circ A_{ij} \lambda_d = \int_{\mathbb{R}} \cdots \int_{\mathbb{R}} f(x_1, \dots, x_i + x_j, \dots, x_d) \lambda_1 \cdots \lambda_d = \int_{\mathbb{R}^d} f \lambda_d$$

by translation invariance. Similarly, $\int_{\mathbb{R}^d} f \circ S_{ij} \lambda_d = \int_{\mathbb{R}^d} f \lambda_d$ and $\int_{\mathbb{R}^d} f \circ M_{ic} \lambda_d = \frac{1}{|c|} \int_{\mathbb{R}^d} f \lambda_d$. Then

$$\begin{aligned} \int_{\mathbb{R}^d} f \circ A \lambda_d &= \int_{\mathbb{R}^d} f \circ A_1 \circ \cdots \circ A_n \lambda_d \\ &= \frac{1}{|\det(A_n)|} \int_{\mathbb{R}^d} f \circ A_1 \circ \cdots \circ A_{n-1} \lambda_d \\ &= \frac{1}{|\det(A)|} \int_{\mathbb{R}^d} f \lambda_d \end{aligned} \quad \blacksquare$$

IV. Complex Measures

11 SIGNED MEASURES

Definition. Let (X, \mathcal{M}, μ) be a measurable space. A (finite) **signed measure** on (X, \mathcal{M}) is a function $\nu : \mathcal{M} \rightarrow \mathbb{R}$ such that

- $\nu(\emptyset) = 0$
- If $E_1, E_2, \dots \in \mathcal{M}$ are disjoint, then $\nu(\bigcup_{i=1}^{\infty} E_i) = \sum_{i=1}^{\infty} \nu(E_i)$.

Remark. 1. It is possible to define a signed measure into $(-\infty, \infty]$ or $[-\infty, \infty)$. For convenience, we work only with the finite case.
 2. As well, note that the series above is always absolutely convergent.
 3. If $F \subseteq E$ in \mathcal{M} , then $\nu(E \setminus F) = \nu(E) - \nu(F)$.

Example. 1. If $\mu_1, \mu_2 : \mathcal{M} \rightarrow [0, \infty)$, then $\nu = \mu_1 - \mu_2$ is a signed measure.
 2. If $\mu : \mathcal{M} \rightarrow [0, \infty]$ is a measure and $f \in L(\mu)$, we define $f \cdot \mu : \mathcal{M} \rightarrow \mathbb{R}$ by $f \cdot \mu(E) = \int_E f \, d\mu = \int_X 1_E f \, d\mu$. This is a signed measure (LDCT).

11.1 Proposition. (i) If $E_1 \subseteq E_2 \subseteq \dots$ in \mathcal{M} , then $\nu(\bigcup_{i=1}^{\infty} E_i) = \lim_{n \rightarrow \infty} \nu(E_n)$.
 (ii) If $E_1 \supseteq E_2 \supseteq \dots$ in \mathcal{M} , then $\nu(\bigcap_{i=1}^{\infty} E_i) = \lim_{n \rightarrow \infty} \nu(E_n)$.

PROOF Identical as the proof as for (non-negative) measures. ■

Definition. Let (X, \mathcal{M}, μ) be a signed measure space. A set $E \in \mathcal{M}$ is **positive** (or **negative** or **null**) for ν if for any $F \subseteq E$, $F \in \mathcal{M}$, we have $\nu(F) \geq 0$ (or $\nu(F) \leq 0$ or $\nu(F) = 0$).

11.2 Lemma. (i) If $P \in \mathcal{M}$ is positive and $Q \subseteq P$, then Q is positive.
 (ii) If $P_1, P_2, \dots \in \mathcal{M}$, then $P = \bigcup_{i=1}^{\infty} P_i$ is positive.

PROOF The first statement is clear. For the second, suppose $E \subseteq P$, $E \in \mathcal{M}$, and let $Q_1 = P_1$, $Q_{n+1} = P_{n+1} \setminus \bigcup_{i=1}^n P_i$. Each Q_n is positive by (i) and $E = \bigcup_{i=1}^{\infty} (E \cap Q_i)$ as $E \subseteq P$. Thus $\nu(E) = \sum_{i=1}^{\infty} \nu(E \cap Q_i) \geq 0$. ■

11.3 Theorem. (Hahn Decomposition) Let (X, \mathcal{M}, μ) be a signed measure space. Then there exist P, N in \mathcal{M} such that

- (i) P is positive for ν .
- (ii) N is negative for ν
- (iii) $P \cup N = X$, $P \cap N = \emptyset$.

Furthermore, if P', N' also satisfy the above constraints, then $P \Delta P'$ and $N \Delta N'$ are each null for ν .

Definition. A pair (P, N) , as above, is called a **Hahn decomposition** for ν .

PROOF Every set named in this proof is assumed to be in \mathcal{M} .

I: If $E \in \mathcal{M}$, $\epsilon > 0$, then there is $E_\epsilon \subseteq E$ such that

1. $\nu(E_\epsilon) \geq \nu(E)$

2. for any $B \subseteq E_\epsilon$, $\nu(B) - \epsilon$.

If not, then every $A \subseteq E$ satisfying (1), there exists $B \subseteq A$ such that $\nu(B) \leq -\epsilon$. Then, inductively, we find

- $B_1 \subseteq E$ such that $\nu(B_1) \leq -\epsilon$ and $\nu(E \setminus B_1) = \nu(E) - \nu(B_1) > \nu(E)$; hence
- $B_2 \subseteq E \setminus B_1$ such that $\nu(B_2) \leq -\epsilon$ and $\nu(E \setminus (B_1 \cup B_2)) = \nu(E) - \sum_{i=1}^2 \nu(B_i) > \nu(E)$.
- $B_{n+1} \subseteq E \setminus \bigcup_{i=1}^n B_i$, with $\nu(B_{n+1}) \leq -\epsilon$ and $\nu(E \setminus \bigcup_{i=1}^{n+1} B_i) > \nu(E)$.

However, as $B_i \cap B_j = \emptyset$, we would have $\nu(\bigcup_{i=1}^\infty B_i) = \sum_{i=1}^\infty \nu(B_i) = -\infty$, violating finiteness of ν .

II: If $E \in \mathcal{M}$, there is a positive $P \subseteq E$ such that $\nu(P) \geq \nu(E)$. Let $E_0 = E_1$ and we use (I) and induction to find $E_n \subseteq E_{n-1}$ such that $\nu(E_n) \geq \nu(E_{n-1})$ and if $B \subseteq E_n$, then $\nu(B) > -1/n$. Let $P = \bigcap_{n=1}^\infty E_n$. By continuity from above, $\nu(P) = \lim_{n \rightarrow \infty} \nu(E_n) \geq \nu(E_0) = \nu(E)$. If $B \subseteq P$, then $B \subseteq E_n$ for each n so $\nu(B) > -1/n$. Thus P is positive for ν .

III: Let $s = \sup\{\nu(E) : E \in \mathcal{M}\}$. Then there is a sequence E_1, E_2, \dots such that $s = \lim_{n \rightarrow \infty} \nu(E_n)$. For each n , find $P_n \subseteq E_n$, which is positive for ν , with $\nu(P_n) \geq \nu(E_n)$. Let $P = \bigcup_{i=1}^\infty P_i$. We note that P is positive for ν and we compute

$$s \geq \nu(P) = \lim_{n \rightarrow \infty} \nu\left(\bigcup_{i=1}^\infty P_i\right) \geq \lim_{n \rightarrow \infty} \nu(P_n) \geq \nu(E_n) = s$$

so $\nu(P) = s$. We let $N = X \setminus P$. If there were $E \subseteq N$ with $\nu(E) > 0$, then $\nu(E \cup P) > \nu(E) + \nu(P) > s$, violating definition of s . Thus $\nu(E) \leq 0$, so N is negative.

IV: Essential Uniqueness If P', N' are another Hahn decomposition, then $P \Delta P' \subseteq N' \cup N$. Then $P \Delta P'$ is positive and negative, and thus null. The same result holds for $N' \Delta N$. ■

11.4 Proposition. Let μ, ν be as above with μ finite. Then $\nu \ll \mu$ if and only if for any $\epsilon > 0$, there is $\delta > 0$ such that for $E \in \mathcal{M}$, $\mu(E) < \delta$ implies $|\nu(E)| < \epsilon$.

PROOF First, since $|\nu(\cdot)| \leq \operatorname{Re} \nu^+ + \dots + \operatorname{Im} \nu^-$, it suffices to show the equivalence for finite measures. Suppose (AC') fails. Then there exists $\epsilon > 0$ such that there is $E_n \in \mathcal{M}$ with $\mu(E_n) < 1/2^n$ while $\nu(E_n) \geq \epsilon$. Let $F_n = \bigcup_{i=n}^\infty E_i$ so $F_1 \supseteq F_2 \supseteq \dots$ with $\mu(F_n) \leq 1/2^{n-1}$ and hence by continuity from above, $\mu(\bigcap_{n=1}^\infty F_n) = \lim_{n \rightarrow \infty} \mu(F_n)$ while

$$\nu\left(\bigcap_{n=1}^\infty F_n\right) = \lim_{n \rightarrow \infty} \nu(F_n) \geq \liminf_{n \rightarrow \infty} \nu(E_n) \geq \epsilon$$

so AC fails. Thus AC implies AC'.

If AC' holds, there is $\delta_n > 0$ so for E in \mathcal{M} , $\mu(E) < \delta_n$ implies $\nu(E) < 1/n$. Hence if $\mu(E) = 0 < \delta_n$ for all n , then $\nu(E) < 1/n$ for any n , i.e. $\nu(E) = 0$. ■

11.5 Lemma. Let $\mu, \nu : \mathcal{M} \rightarrow [0, \infty)$ be finite measures. Then either $\mu \perp \nu$ or to every $\epsilon > 0$ and $E \in \mathcal{M}$ for which $\mu(E) > 0$ and E is positive $\nu - \epsilon\mu$.

PROOF Let (P_n, N_n) be a Hahn decomposition for $\nu - \frac{1}{n}\mu$ and $P = \bigcup_{n=1}^\infty P_n$, $N = X \setminus P = \bigcap_{n=1}^\infty N_n$. Then N is negative for each $\nu - \frac{1}{n}\mu$, so $0 \leq \nu(N) \leq \frac{1}{n}\mu(N)$ for each n , so $\nu(N) = 0$. If $\mu(P) = 0$, then $\nu \perp \mu$. Otherwise, $\mu(P) > 0$, so $\mu(P_n) > 0$ for some n , and $E = P_n$ satisfies $\mu(E) > 0$ and $(\nu - \frac{1}{n}\mu)(E) > 0$. ■

11.6 Theorem. (Lebesgue-Radon-Nikodym) Let (X, \mathcal{M}) be a measurable space, $\nu : \mathcal{M} \rightarrow \mathbb{C}$ a complex measure and $\mu : \mathcal{M} \rightarrow [0, \infty]$ be a σ -finite measure. Then

- (i) There is a unique complex measure $\rho : \mathcal{M} \rightarrow \mathbb{C}$ such that $\rho \perp \mu$ and $\nu - \rho \ll \mu$
- (ii) There is $f \in L(\mu)$ such that $\nu - \rho = f \cdot \mu$.

Remark. The decomposition $\nu = \rho + (\nu - \rho)$ is called the **Lebesgue decomposition** of ν with respect to μ . The element $f \in L(\mu)$, above, is called the **Radon-Nikodym derivative** of ν with respect to μ . We will often write $f = \frac{\nu}{\mu}$.

PROOF (I) Assume $\mu, \nu : \mathcal{M} \rightarrow [0, \infty)$ are finite measures. Let

$$\mathcal{F} = \{f \in \overline{M}^+(X, \mathcal{M}) : \int_E f \mu \leq \nu(E) \text{ for all } E \text{ in } \mathcal{M}\}$$

Indeed, let $A = \{x \in X : f(x) > g(x)\}$. Then for $E \in \mathcal{M}$,

$$\int_E \max\{f, g\} \mu = \int_{E \cap A} f \mu + \int_{E \setminus A} g \mu \leq \nu(E \cap A) + \nu(E \setminus A) = \nu(E)$$

Thus if $f_1, \dots, f_n \in \mathcal{F}$, then $\max\{f_1, \dots, f_n\} \in \mathcal{F}$. Let $s = \sup\{\int_X f \mu : f \in \mathcal{F}\} \leq \nu(X) < \infty$. Hence for each n , there is $f_n \in \mathcal{F}$ such that $s - \frac{1}{n} < \int_X f_n \mu \leq s$. We let $g_n = \max\{f_1, \dots, f_n\} \in \mathcal{F}$ so $g_n \leq g_{n+1}$, and we let $f = \lim_{n \rightarrow \infty} g_n$. Then

$$s \geq \lim_{n \rightarrow \infty} \int_X g_n \mu \geq \lim_{n \rightarrow \infty} \int_X f_n \mu \geq \lim_{n \rightarrow \infty} \left(s - \frac{1}{n}\right) = s$$

so $s = \lim_{n \rightarrow \infty} \int_X g_n \mu = \int_X f \mu$ by monotone convergence. In particular, $f \in \overline{L}^+(\mu)$, so we may assume that $f \in L^+(\mu)$ (i.e. \mathbb{R} -valued). Again, by MCT,

$$\int_E f \mu = \lim_{n \rightarrow \infty} \int_E g_n \mu \leq \lim_{n \rightarrow \infty} \nu(E) = \nu(E)$$

so $f \in \mathcal{F}$.

Now, let $\rho = \nu - f \cdot \mu$, which is non-negative as $f \in \mathcal{F}$. If $\rho \not\perp \mu$, then the last lemma provides $\epsilon > 0$ and $E \in \mathcal{M}$ which is positive such that

$$\rho - \epsilon \mu = (\nu - f \cdot \mu) - \epsilon \mu = \nu - (f + \epsilon 1) \mu$$

i.e. for $B \subseteq E$, $B \in \mathcal{M}$, $\int_B (f + \epsilon 1) \mu = (f + \epsilon 1) \mu(B) \leq \nu(B)$. Hence if $A \in \mathcal{M}$, we have

$$\begin{aligned} \int_A (f + \epsilon 1_E) \mu &= \int_{A \setminus E} f \mu + \int_A (f + \epsilon 1_E) \mu \\ &\leq \nu(A \setminus E) + \nu(A \cap E) \end{aligned}$$

so $f + \epsilon 1_E \in \mathcal{F}$. However,

$$\int_X (f + \epsilon 1_E) \mu = \int_X f \mu + \epsilon \mu(E) = s + \epsilon \mu(E) > s$$

But these last two statements contradict definitions of \mathcal{F} and s . Thus $\rho \perp \mu$.

(II) Assume $\nu : \mathcal{M} \rightarrow [0, \infty)$ and $\mu : \mathcal{M} \rightarrow [0, \infty]$ is σ -finite. We get $(X_n)_{n=1}^\infty \subseteq \mathcal{M}$ such that $X = \bigcup_{n=1}^\infty X_n$ and each $X_n \in \mathcal{M}$ has $\mu(X_n) < \infty$. Let $\nu_x = \nu_{X_n}$, $\mu_i = \mu_{X_i}$. Apply (I) to pairs (ν_i, μ_i) to obtain measures $\rho_i : \mathcal{M}_{X_i} \rightarrow [0, \infty)$ $\rho_i \perp \mu_i$ and $\nu_i - \rho_i = f_i \cdot \mu_i \ll \mu_i$ where $f_i \in L^+(\mu_i)$. Define

- $\rho : \mathcal{M} \rightarrow [0, \infty]$ by $\rho(E) = \sum_{i=1}^{\infty} \rho_i(E \cap X_i)$
- $f : X \rightarrow [0, \infty)$ by $f(x) = f_i(x)$ if $x \in X_i$.

It is easily checked that ρ defines a measure and that $f \in M^+(X, \mathcal{M})$. If (E_i, F_i) realize (E_i, F_i) realizes $\rho_i \perp \mu_i$, then $(\bigcup_{i=1}^{\infty} E_i, \bigcup_{i=1}^{\infty} F_i)$ realizes $\rho \perp \mu$. Furthermore, for $E \in \mathcal{M}$ we have

$$\begin{aligned} \nu(E) &= \sum_{i=1}^{\infty} \nu(E \cap X_i) = \sum_{i=1}^{\infty} \left(\rho_i(E \cap X_i) + \int_{E \cap X_i} f_i \mu_i \right) \\ &= \rho(E) + \int_E f \mu \end{aligned}$$

by monotone convergence. In particular, since $\nu(X) < \infty$, we see that ρ is a finite measure and $f \in L^+(\mu)$.

(III) Now suppose $\nu : \mathcal{M} \rightarrow \mathbb{C}$, $\mu : \mathcal{M} \rightarrow [0, \infty]$ is σ -finite. Apply the Jordan decomposition so that $\nu = (\operatorname{Re} \nu^+ - \operatorname{Re} \nu^-) + i(\operatorname{Im} \nu^+ - \operatorname{Im} \nu^-)$. Apply (II) to each component to get (ρ_i, f_i) and let $\rho = \rho_1 - \rho_2 + i(\rho_3 - \rho_4)$ and $f = f_1 - f_2 + i(f_3 - f_4)$, which certainly satisfy the properties.

(IV) Uniqueness. Suppose we have $\rho, \rho' : \mathcal{M} \rightarrow \mathbb{C}$ satisfying the requirements. Since $\rho + (\nu - \rho) = \nu = \rho' + (\nu - \rho')$, we have $\rho - \rho' = (\nu - \rho') - (\nu - \rho)$ simultaneously singular and absolutely continuous with respect to μ , so $\rho - \rho' = 0$. ■

THE RADON-NIKODYM DERIVATIVE

Definition.

Let us assume above that $\nu \ll \mu$, so (L-)R-N tells us that $\nu = f \cdot \mu$ for some $f \in L(\mu)$.

1. If $f \in L(\mu)$, $f \cdot \mu = 0$ if and only if $1_E f = 0$ μ -a.e. for each $E \in \mathcal{M}$ if and only if $f = 0$ μ -a.e. Hence if $f, g \in L(\mu)$, then $f \cdot \mu = g \cdot \mu$ if and only if $f = g$ μ -a.e.
2. We let $L^1(\mu) = L(\mu) / \sim_\mu$ where $f \sim_\mu g$ if and only if $f = g$ μ -a.e. Pointwise μ -a.e. operations are legal.

If $\nu = f \cdot \mu$ as above, we write $f = \frac{\nu}{\mu}$ in $L^1(\mu)$, so $\nu = \frac{\nu}{\mu} \cdot \mu$.

Definition. Let $\nu : \mathcal{M} \rightarrow \mathbb{C}$ be a complex measure. We let $L(\nu) = L(\operatorname{Re} \nu^+) \cap \dots \cap L(\operatorname{Im} \nu^-)$ and for $f \in L(\nu)$, we define the **Lebesgue integral** by

$$\int_X f \nu = \int_X f(\operatorname{Re} \nu^+) - \int_X f(\operatorname{Re} \nu^-) + i \left[\int_X f(\operatorname{Im} \nu^+) - \int_X f(\operatorname{Im} \nu^-) \right]$$

We let $L^1(\nu) = L(\nu) / \sim_\nu$.

11.7 Proposition. Let ν be a complex measure, μ a finite measure, and λ a σ -finite measure, on a measurable space X . Then

(i) If $\nu \ll \lambda$, then for $g \in L(\nu)$, $g \frac{\nu}{\lambda} \in L^1(\lambda)$.

(ii) If $\nu \ll \mu$, $\mu \ll \lambda$, then $\nu \ll \lambda$ and $\frac{\nu}{\lambda} = \frac{\nu}{\mu} \frac{\mu}{\lambda}$.

PROOF (Roman*) If $E \in \mathcal{M}$, then $\int 1_E \nu = \nu(E) = \frac{\nu}{\lambda} \cdot \lambda(E) = \int 1_E \frac{\nu}{\lambda} \lambda$. Thus the result holds by LDCT.

(roman*) If $E \in \mathcal{M}$, if $\lambda(E) = 0$, then $\mu(E) = 0$ so $\nu(E) = 0$ so $\nu \ll \lambda$. Then for any $E \in \mathcal{M}$, apply (i) to get

$$\begin{aligned} \int 1_E \frac{\nu}{\lambda} \lambda &= \nu(E) = \int 1_E \frac{\nu}{\mu} \mu \\ &= \int 1_E \frac{\nu}{\mu} \cdot \frac{\mu}{\lambda} \lambda \end{aligned}$$

and from above, $\frac{\nu}{\lambda} = \frac{\nu}{\mu} \frac{\mu}{\lambda}$ λ -a.e. ■

12 L^p -SPACES

Let (X, \mathcal{M}, μ) be a measure space. Recall that $L^1(\mu) = L(\mu)/\sim_\mu$. Likewise, if $1 < p < \infty$, then we let $L^p(\mu) = \{f \in M(X, \mathcal{M}) : \int_X |f|^p \mu < \infty\}/\sim_\mu$. Note that the functional $\|\cdot\|_1$ on $L^1(\mu)$ given by $\|f\|_1 = \int_X |f| \mu$ is a norm on $L^1(\mu)$.

If $\phi : \mathbb{R} \rightarrow \mathbb{R}$ is twice differentiable and for which $\phi'' > 0$, then ϕ is **strictly convex**. If $x < y$ in \mathbb{R} , $0 < t < 1$, then $\phi((1-t)x + ty) < (1-t)\phi(x) + t\phi(y)$.

12.1 Proposition. (Young's Inequality) If $a, b \geq 0$, $p, q > 1$, $\frac{1}{p} + \frac{1}{q} = 1$, then $ab \leq \frac{1}{p} a^{\frac{1}{p}} b^{\frac{1}{q}}$ with equality if $a^p = b^q$.

PROOF By convexity of e^x ,

$$ab = e^{\log(ab)} = e^{\frac{1}{p} \log(a^p) + \frac{1}{q} \log(b^q)} \leq \frac{1}{p} e^{\log(a^p)} + \frac{1}{q} e^{\log(b^q)} = \frac{1}{p} a^{\frac{1}{p}} + \frac{1}{q} b^{\frac{1}{q}}$$

and equality holds if and only if $a^p = b^q$. ■

Remark. If $f, g \in L^{\mathbb{R}}(\mu)$, $f \geq g$ μ -a.e. and $f \neq g$ μ -a.e, then $\int_X f \mu > \int_X g \mu$. Indeed, $(f - g) \cdot \mu$ is a non-zero (positive) measure.

12.2 Proposition. (Hölder's Inequality) Let $p, q > 1$, $\frac{1}{p} + \frac{1}{q} = 1$, $f \in L^p(\mu)$, $g \in L^q(\mu)$. Then $fg \in L^1(\mu)$ with

$$\|fg\|_1 \leq \|f\|_p \|g\|_q$$

with equality holding only if there are $\alpha, \beta \geq 0$ such that $\alpha|f|^p = \beta|g|^q$ μ -a.e.

PROOF We may assume that $\|f\|_p \|g\|_q > 0$. By Young's inequality,

$$\frac{|f(x)g(x)|}{\|f\|_p \|g\|_q} \leq \frac{1}{p} \frac{|f(x)|^p}{\|f\|_p^p} + \frac{1}{q} \frac{|g(x)|^q}{\|g\|_q^q}$$

Integrate over X and multiply by $\|f\|_p^p \|g\|_q^q$ to see that

$$\begin{aligned} \|fg\|_1 &\leq \frac{1}{p} \cdot \frac{\|f\|_p^p}{\|f\|_p^{p-1}} \|g\|_q + \frac{1}{q} \frac{\|g\|_q^q}{\|g\|_q^{q-1}} \|f\|_p \\ &\leq \left(\frac{1}{p} + \frac{1}{q} \right) \|f\|_p \|g\|_q \end{aligned}$$

with equality holding if and only if $\|g\|_q^q |f|^p = \|f\|_p^p |g|^q$. ■

Remark. We define $\text{sgn} : \mathbb{C} \rightarrow \mathbb{C}$ by $\text{sgn}(z) = \frac{z}{|z|}$ if $z \neq 0$, and 0 if $z = 0$.

12.3 Proposition. (Minkowski's Inequality) If $p > 1$ and $f, g \in L^p(\mu)$, then $f + g \in L^p(\mu)$ with $\|f + g\|_p \leq \|f\|_p + \|g\|_q$ with equality if and only if $\text{sgn } f = \text{sgn } g$ μ -a.e. and there are $\alpha, \beta \geq 0$ so $\alpha|f| = \beta|g|$ μ -a.e.

PROOF We have, by Hölder's inequality used twice,

$$\begin{aligned} |f + g|^p &= |f + g||f + g|^{p-1} \\ &\leq (|f| + |g|)|f + g|^{p-1} \\ &\leq \|f\|_p \| |f + g|^{p-1} \|_q + \|g\|_q \| |f + g|^{p-1} \|_q \\ &= (\|f\|_p + \|g\|_q) \| |f + g|^{p-1} \|_q \end{aligned} \quad (*)$$

where equality holds at the first inequality $\text{sgn } f = \text{sgn } g$, and at the second inequality $\alpha|f|^p = \|f\|_p \| |f + g|^{p-1} \|_q$ and $\alpha|g|^p = \|g\|_p \| |f + g|^{p-1} \|_q$ where $\alpha = \| |f + g|^{p-1} \|_q$. Notice that $q(p-1) = p$ so that

$$\| |f + g|^{p-1} \|_q = \left(\int |f + g|^{(p-1)q} \right)^{1/q} = \|f + g\|_p^{p/q}$$

Furthermore, $|f + g|^p \leq (|f| + |g|)^p \leq 2^p \max\{|f|, |g|\}^p \in L^1(\mu)$. Thus by (*),

$$\|f + g\|_p = \frac{\|f + g\|_p^p}{\|f + g\|_p^{p/q}} \leq \|f\|_p + \|g\|_q$$

and the equality situation is described above. ■

Remark. This implies that $(L^p(\mu), \|\cdot\|_p)$ is a normed space.

12.4 Lemma. Let $(L, \|\cdot\|)$ be a normed space. Then $(L, \|\cdot\|)$ is a Banach space if and only if $\sum_{k=1}^{\infty} f_k$ converges in L whenever $\sum_{k=1}^{\infty} \|f_k\| < \infty$ in \mathbb{R} .

PROOF (\Leftarrow) Let $(f_n)_{n=1}^{\infty}$ be Cauchy in $(L, \|\cdot\|)$. Then we can find a subsequence $(f_{n_k})_{k=1}^{\infty}$ such that $\|f_{n_{k+1}} - f_{n_k}\| < 1/2^k$ for each k . We then use our assumption to let $f = f_{n_1} + \sum_{k=1}^{\infty} (f_{n_{k+1}} - f_{n_k}) \in L$. Check that $f = \lim f_{n_k}$, so $f = \lim f_n$. ■

12.5 Theorem. Let (X, \mathcal{M}, μ) be a measure space and $1 \leq p < \infty$. Then $(L^p(\mu), \|\cdot\|_p)$ is a Banach space.

PROOF We use the lemma. Let $(f_k)_{k=1}^{\infty} \subset L^p(\mu)$ such that $s = \sum_{k=1}^{\infty} \|f_k\|_p < \infty$. We think of each f_k as an element of $M(X, \mathcal{M})$. Let for $n \in \mathbb{N}$ $g_n = \sum_{k=1}^n |f_k|$ and $g = \sum_{k=1}^{\infty} |f_k| \in M^+(X, \mathcal{M})$. Now by Minkowski's inequality,

$$\|g_n\|_p \leq \sum_{k=1}^n \|f_k\|_p \leq s$$

so

$$\|g_n\|^p \leq s^p$$

and hence by monotone convergence

$$\int |g|^p = \lim_{n \rightarrow \infty} \int |g_n|^p \leq s^p < \infty$$

so $|g|^p \in \bar{L}^+(\mu)$. By replacing values on a null set, we may assume $|g|^q \in L^+(\mu)$. Now, set $f(x) = \sum_{k=1}^{\infty} f_k(x)$ for μ -a.e. x in X . Then $|f| \leq \sum_{k=1}^{\infty} |f_k| \leq |g|$ which shows that f is finite and thus μ -a.e. equivalent to an element of $M(X, \mathcal{M})$, which we will also call f . Since $|f|^p \leq |g|^p$ we see that $f \in L^p(\mu)$. Now for each n ,

$$\left| f - \sum_{k=1}^n f_k \right|^p \leq \left(|f| + \sum_{k=1}^n |f_k| \right)^p \leq |g|^p \in L(\mu)$$

and $\lim_{n \rightarrow \infty} \left| f - \sum_{k=1}^n f_k \right|^p = 0$ μ -a.e. Thus by LDCT, we have

$$\left\| f - \sum_{k=1}^n f_k \right\|_p^p = \int \left| f - \sum_{k=1}^n f_k \right|^p$$

so $f = \sum_{k=1}^{\infty} f_k \in L^p(\mu)$. ■

Definition. Let $(L, \|\cdot\|)$ be a \mathbb{C} -normed Banach space. We let its **dual space** be

$$L^* = \{ \Phi : L \rightarrow \mathbb{C} \mid \Phi \text{ linear and } \|\Phi\|_* = \sup\{|\Phi(f)| : f \in L, \|f\| \leq 1\} < \infty \}$$

Remark. 1. L^* is itself a \mathbb{C} -vector space with norm $\|\cdot\|_*$:

$$\begin{aligned} \|\Phi\|_* = 0 &\Leftrightarrow |\Phi(f)| = 0 \text{ for all } f \in L, \|f\| \leq 1 \\ &\Leftrightarrow \Phi(f) = \|f\| \Phi\left(\frac{1}{\|f\|} f\right) = 0 \text{ for all } f \in L \setminus \{0\} \\ &\Leftrightarrow \Phi = 0 \end{aligned}$$

Linearity and respecting scalars is obvious.

2. If $\Phi \in L^*$, Φ is Lipschitz, hence continuous. Indeed, if $f \in L \setminus \{0\}$, then $|\Phi(f)| = \|f\| \left| \Phi\left(\frac{1}{\|f\|} f\right) \right| \leq \|\Phi\|_* \|f\|$ and hence if $f, g \in L$, $|\Phi(f) - \Phi(g)| = |\Phi(f - g)| \leq \|\Phi\|_* \|f - g\|$.

12.6 Theorem. Let (X, \mathcal{M}, μ) be a measure space, $p, q > 1$, $\frac{1}{p} + \frac{1}{q} = 1$.

(i) For $g \in L^q(\mu)$ we have $\Phi_g \in L^p(\mu)^*$ given by

$$\Phi_g(f) = \int_X f g \mu$$

satisfies $\|\Phi_g\|_* = \|g\|_q$

(ii) If $\Phi \in L^p(\mu)^*$, then $\Phi = \Phi_g$ for some $g \in L^q(\mu)$. Hence, $g \mapsto \Phi_g : L^q(\mu) \rightarrow L^p(\mu)^*$ is an isometric surjection.

PROOF (i) First notice for $f \in L^p(\mu)$,

$$\int |fg| = \|fg\|_1 \leq \|f\|_p \|g\|_q$$

so $fg \in L^1(\mu)$, so $\Phi_g(f) = \int fg$ makes sense. Again, we use Hölder's inequality to see for $f \in L^p(\mu)$ with $\|f\|_p \leq 1$, we have

$$|\Phi_g(f)| = \left| \int fg \right| \leq \int |fg| = \|fg\|_1 \leq \|f\|_p \|g\|_q \leq \|g\|_q$$

so $\|\Phi_g\|_* \leq \|g\|_q$. To see the converse inequality, for $g \neq 0$, let

$$f = \frac{1}{\|g\|_q^{q-1}} |g|^{q-1} \overline{\text{sgn } g}$$

Then $\frac{1}{p} = 1 - \frac{1}{q} = \frac{q-1}{q}$, $q = (q-1)p$ and we have

$$\int |f|^p \leq \frac{1}{\|g\|_q^{(q-1)p}} \int |g|^{(q-1)p} = \frac{1}{\|g\|_q^q} \int |g|^q = 1$$

so $\|f\|_p \leq 1$. Thus

$$\begin{aligned} \|\Phi_g\|_* &\geq |\Phi_g(f)| = \left| \frac{1}{\|g\|_q^{q-1}} \int |g|^{q-1} \overline{\text{sgn } g} g \right| \\ &= \frac{1}{\|g\|_q^{q-1}} \int |g|^q = \frac{\|g\|_q^q}{\|g\|_q^{q-1}} = \|g\|_q \end{aligned}$$

(ii) Let $\Phi \in L^p(\mu)^*$. (I) Suppose that $\mu(X) < \infty$. Let $\nu : \mathcal{M} \rightarrow \mathbb{C}$ be $\nu(E) = \Phi(1_E)$. Then $\nu(\emptyset) = \Phi(1_\emptyset) = 0$. If $E_1, E_2, \dots \in \mathcal{M}$, $E_i \cap E_j = \emptyset$ for $i \neq j$, then $E = \bigcup_{i=1}^\infty E_i$ and we have

$$\begin{aligned} \left\| 1_E - \sum_{i=1}^n 1_{E_i} \right\|_p^p &= \int |1_{\bigcup_{i=n+1}^\infty E_i}|^p \mu \\ &= \mu \left(\bigcup_{i=n+1}^\infty E_i \right) \\ &= \sum_{i=n+1}^\infty \mu(E_i) \end{aligned}$$

which goes to 0 as $n \rightarrow \infty$. Thus $1_E = \lim_{n \rightarrow \infty} \sum_{i=1}^n 1_{E_i}$ in $L^p(\mu)$. Thus, as Φ is linear and continuous, we have

$$\nu(E) = \Phi(1_E) = \Phi \left(\lim_{n \rightarrow \infty} \sum_{i=1}^n 1_{E_i} \right) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \Phi(1_{E_i}) = \lim_{n \rightarrow \infty} \sum_{i=1}^n \nu(E_i) = \sum_{i=1}^\infty \nu(E_i)$$

and thus ν is a \mathbb{C} -measure. Furthermore, if $E \in \mathcal{M}$ satisfies $\mu(E) = 0$, then $1_E = 0$ μ -a.e, so $\nu(E) = \Phi(1_E) = \Phi(0) = 0$ and $\nu \ll \mu$. Thus the Radon-Nikodym Theorem provides $g = \frac{\nu}{\mu}$ in $L^1(\mu)$ such that $\nu(E) = \int_E g \mu$.

We now show that $g \in L^q(\mu)$. First, if $f \in M(X, \mathcal{M})/\sim_\mu$ is essentially bounded, then

$$\int |fg| \mu \leq \int M|g| \mu = M\|g\| < \infty$$

so $fg \in L^1(\mu)$. We then note that

$$M(g) \geq \sup\left\{\left|\int fg \mu\right| : f \in M(X, \mathcal{M})/\sim_\mu \text{ is essentially bounded and } \|f\|_p \leq 1\right\} \quad (*)$$

For f as in $(*)$, we find $(\psi_n)_{n=1}^\infty \subset S(X, \mathcal{M})/\sim_\mu$ such that $f = \lim_{n \rightarrow \infty} \psi_n$ μ -a.e. and such that $|\psi_n| \leq |f|$. Notice for $\phi \in S(X, \mathcal{M})/\sim_\mu$, $\psi = \sum_{j=1}^n c_j 1_{E_j}$ in standard form, that

$$\begin{aligned} \Phi(\psi) &= \sum_{j=1}^m c_j \Phi(1_{E_j}) = \sum_{j=1}^n c_j \nu(E_j) \\ &= \sum_{j=1}^m c_j \int_X 1_{E_j} g \mu = \int \psi g \mu \end{aligned}$$

Thus, $|\psi_n - f|^p \leq (|\psi_n| + |f|)^p \leq 2^p |f|^p \in L^1(\mu)$ so by LDCT,

$$\lim_{n \rightarrow \infty} \|\psi_n - f\|_p^p = \lim_{n \rightarrow \infty} \int |\psi_n - f|^p \mu = 0$$

and $|\psi_n g| = |\psi_n| |g| \leq |f| |g| \in L^1(\mu)$. Thus for such f , using continuity of ϕ , and then LDCT,

$$\Phi(f) = \lim_{n \rightarrow \infty} \Phi(\psi_n) = \lim_{n \rightarrow \infty} \int \psi_n g \mu = \int f g \mu$$

Thus we see that $M(g) \leq \|\Phi\|_* < \infty$. Now we let $(\varphi_n)_{n=1}^\infty \subset S(X, \mathcal{M})/\sim_\mu$ such that $\lim \varphi_n = g$ and $|\varphi_n| \leq |\varphi_{n+1}| \leq |g|$. We define

$$f_n = \frac{1}{\|\varphi_n\|_q^{q-1}} |\varphi_n|^{q-1} \overline{\text{sgn } g}$$

which is essentially bounded and with $\int |f_n|^p \mu \leq 1$ as above. Furthermore, by MCT,

$$\int |g|^q \mu = \lim_{n \rightarrow \infty} \int |\varphi_n|^q \mu$$

and we compute

$$\begin{aligned} \|g\|_q &= \lim_{n \rightarrow \infty} \|\varphi_n\|_q = \lim_{n \rightarrow \infty} \frac{1}{\|\varphi_n\|_q^{q-1}} \int |\varphi_n|^q \mu \\ &= \lim_{n \rightarrow \infty} \int |f_n| |\varphi_n| \mu \leq \liminf_{n \rightarrow \infty} \int |f_n| |g| \mu \\ &= \liminf \int f_n g \mu \leq \|\Phi\|_\infty < \infty \end{aligned}$$

so $g \in L^q(\mu)$. We see that $\Phi = \Phi_g$ by mimicking the same computation as earlier, but for f not necessarily essentially bounded.

(II) Assume now that μ is a general measure. If $E \in \mathcal{M}$, identify $L^p(\mu_E) \cong 1_E L^p(\mu) \subseteq L^p(\mu)$ and likewise for q . If $F \in \mathcal{M}$, $\mu(F) < \infty$, then (I) provides g_F in $1_F L^p(\mu)$ such that $\phi(1_F f) = \int_F f g_F \mu = \int_X f g_F \mu$ as $g_F = 1_F g_F$. Notice that if $F \subseteq F'$, where $F' \in \mathcal{M}$, $\mu(F') < \infty$, then $g_F = g_{F'}$ μ_F -a.e. Hence if $F_1, F_2, \dots \in \mathcal{M}$, each $\mu(F_i) < \infty$, then on $E = \bigcup_{i=1}^{\infty} F_i$, we may uniquely define g_E so $g_E = g_{F_n}$ μ_{F_n} -a.e. and $1_E g_E = g_E$. Let $E_n = \bigcup_{i=1}^n F_i$, and MCT and (I) and (i) provide

$$\int |g_E|^q \mu = \lim_{n \rightarrow \infty} \int |g_{E_n}|^q \mu = \lim_{n \rightarrow \infty} \|\Phi|_{1_{E_n} L^p(\mu)}\|_* \leq \|\Phi\|_*$$

so that $g_E \in L^q(\mu)$. In fact, $g_E = 1_E L^q(\mu)$. We then let

$$s = \sup \left\{ \int |g_E|^q : E \in \mathcal{M} \text{ is } \sigma\text{-finite for } \mu \right\} \leq \|\Phi\|_* < \infty$$

Then let $E_1, E_2, \dots \in \mathcal{M}$ each be σ -finite for μ , such that $\lim_{n \rightarrow \infty} |g_{E_n}|^q = s$. Then $E = \bigcup_{i=1}^{\infty} E_i$ is σ -finite, and again using MCT,

$$s \geq \int |g_E|^q \mu = \lim_{n \rightarrow \infty} \int |g_{\bigcup_{i=1}^n E_i}|^q \mu \geq \lim_{n \rightarrow \infty} \int |g_{E_n}|^q \mu = s$$

so that $s = \int |g_E|^q \mu = s$. Now if $E' \in \mathcal{M}$ is σ -finite for μ such that

$$s + \int |g_{E' \setminus E}|^q \mu = \int |g_E|^q \mu + \int |g_{E' \setminus E}|^q \mu = \int |g_{E \cup E'}|^q \mu \leq s$$

and we conclude that $g_{E' \setminus E} = 0$ μ -a.e.

Finally, if $f \in L^p(\mu)$, we think of f as a function and let

$$E_f = \bigcup_{n=1}^{\infty} \left\{ x \in X : |f(x)|^p < \frac{1}{n} \right\}$$

so E_f is σ -finite. Decompose $E_f \cup E = \bigcup_{i=1}^{\infty} E_i$, each $E_i \in \mathcal{M}$, $\mu(E_i) < \infty$, $E_1 \subseteq E_2 \subseteq \dots$ and we have

- $\lim_{n \rightarrow \infty} \|f - 1_{E_n} f\|_p = 0$ (LDCT argument we saw in (I))
- $|f g_{E_n}| \leq |f g_E| \in L^1(\mu)$

Thus by continuity of Φ , by LDCT and (I),

$$\Phi(f) = \lim_{n \rightarrow \infty} \Phi(1_{E_n} f) = \lim_{n \rightarrow \infty} \int 1_{E_n} f g_E \mu = \int f g_E \mu$$

Hence $\Phi = \Phi_{g_E}$. ■

13 RADON MEASURES

Definition. Let (X, d) be a metric space. We say that (X, d) is **locally compact** if for each $x \in X$, there is $\epsilon_x > 0$ such that $\overline{B_{\epsilon_x}(x)}$ is compact.

Example. (i) \mathbb{R}^d with the usual metric is locally compact. Any closed ball $\overline{B_\epsilon(x)}$ is compact (Heine-Borel)

(ii) Let X be any non-empty set, d the discrete metric. If $x \in X$, then $B_\epsilon(x) = \overline{B_\epsilon(x)}$ is compact, provided that X is infinite, exactly for $0 < \epsilon \leq 1$. Note that we distinguish $\overline{B_\epsilon(x)}$ from $\overline{B_\epsilon}(x) = \{y : d(x, y) < \epsilon\}$.

(iii) If C is a closed subset and U an open subset of a locally compact space, then C, U and $C \cap U, C \cup U$ are locally compact.

Definition. Let (X, d) be a locally compact metric space. A measure $\mu : \mathcal{B}(X) \rightarrow [0, \infty]$ is called a **Radon measure** if it satisfies

- (outer regularity) For $E \in \mathcal{B}(X)$, $\mu(E) = \inf\{\mu(U) : E \subseteq U, U \text{ open}\}$.
- (locally finite) For $K \subseteq X$ compact, $\mu(K) < \infty$
- (inner regular on open sets) If $U \subseteq X$ is open, then $\mu(U) = \sup\{\mu(K) : K \subseteq U, K \text{ is compact}\}$.

13.1 Proposition. Let μ be a Radon measure, as above. Then if $E \in \mathcal{B}(X)$ such that $\mu(E) < \infty$, then inner regularity holds for E as well. Thus, if X is σ -finite for μ , then μ is inner regular for each $E \in \mathcal{B}(X)$.

PROOF First assume that $\mu(E) < \infty$. Let $\epsilon > 0$. Let

- $E \subseteq U$, U open, $\mu(E) < \mu(U) + \epsilon$ implies $\mu(U \setminus E) < \epsilon$.
- $F \subseteq U$, F compact, $\mu(U) < \mu(F) + \epsilon$, and
- $U \setminus E \subseteq C$, so V is open and $\mu(V) < \epsilon$.

Let $K = F \setminus V = F \cap (X \setminus V) \subseteq F \setminus (U \setminus E) \subseteq F \cap E \subseteq E$ and is compact with

$$\begin{aligned} \mu(K) &= \mu(F) - \mu(F \cap V) \\ &> \mu(U) - \epsilon - \mu(V) > \mu(E) - 2\epsilon \end{aligned}$$

Now, if E is σ -finite for μ , write $E = \bigcup_{i=1}^{\infty} E_i$, each $E_i \in \mathcal{B}(X)$, $\mu(E_i) < \infty$, $E_1 \subseteq E_2 \subseteq \dots$. For each n , let $K_n \subseteq E_n$ such that $\mu(K_n) \leq \mu(E_n) < \mu(K_n) + 1/n$. Then by continuity from below, $\mu(E) = \lim \mu(E_n) = \lim \mu(K_n)$ so $\mu(E) = \sup_{n \in \mathbb{N}} \mu(K_n)$. ■

Remark. We say that (X, d) is σ -compact if $X = \bigcup_{n=1}^{\infty} K_n$, where each K_n is compact. If μ is a Radon measure, then σ -compact implies σ -finite.

V. Fourier Series

If f is the sum $f(x) = a_0 + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$. Then, assuming we can integrate term by term,

$$a_0 = \frac{1}{2\pi} \int_{-\pi}^{\pi} f(x) dx, \quad a_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \cos nx dx, \quad b_n = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin nx dx$$

Riesz Representation Theorem. Let (X, d) be a metric space, $I : C_c(X) \rightarrow \mathbb{C}$ a positive linear functional. Then there is a unique Radon measure $\mu : \mathcal{B}(X) \rightarrow [0, \infty]$ such that $I(f) = \int_X f d\mu$, $f \in C_c(X)$. We let $U \subseteq X$, $\mu^0(U) = \sup\{I(f) : f \leq U\}$, $E \subseteq X$, $\mu^*(E) = \inf\{\sum_{i=1}^{\infty} \mu^0(E_i) : U \subseteq \bigcup_{i=1}^{\infty} U_i, U_i \in \tau\}$.

(III) We have that $\mathcal{B}(X) \subseteq \mathcal{M}$. In particular, $\mu = \mu^*|_{\mathcal{B}(X)}$ satisfies $\mu(U) = \mu^*(U)$ for U open, and μ is outer regular, by (I), and locally finite, by (II). It suffices to show that $U \in \mathcal{M}$ whenever U is open.

Suppose $V \subseteq X$ is open with $\mu^*(V) < \infty$ (say \bar{V} is compact), and let $\epsilon > 0$. We let

- $f < U \cap V$ be so $\mu^*(U) \cap V < I(f) + \epsilon$
- $g < V \setminus \text{supp } f$ be such $\mu^*(V \setminus \text{supp } f) < I(g) + \epsilon$

Then $f + g < V$ as $\text{supp } f \cap \text{supp } g = \emptyset$, and we have

$$\begin{aligned} \mu^*(V \cap U) + \mu^*(V \setminus U) &< I(f) + \epsilon + \mu^*(V \setminus \text{supp } f) \\ &< I(f) + I(g) + 2\epsilon \\ &= I(f + g) + 2\epsilon \\ &\leq \mu^0(V) + 2\epsilon = \mu^*(V) + 2\epsilon \end{aligned}$$

so, since $\epsilon > 0$ is arbitrary, $\mu^*(V \cap U) + \mu^*(V \setminus U) \leq \mu^*(V)$. Now, if $E \subseteq X$, $\mu^*(E) < \infty$, for each $\epsilon > 0$ we find open $V \supseteq E$ such that $\mu^*(V) = \mu^0(E) < \mu^*(E) + \epsilon$. Then

$$\mu^*(E) + \epsilon > \mu^*(V) \geq \mu^*(V \cap U) + \mu^*(V \setminus U) \geq \mu^*(E \cap U) + \mu^*(E \setminus U)$$

and since ϵ is arbitrary, $\mu^0(E) \geq \mu^*(E \cap U) + \mu^*(E \setminus U)$. Notice that this also holds immediately if $\mu^*(E) = \infty$.

(IV) $I(f) = \int_X f d\mu$ for f in $C_c(X)$. First, if $f \in C_c(X)$, we may write $f_1 - f_2 + i(f_3 - f_4)$ where $f_i \geq 0$. Let $M_i = \sup\{f_i(x) : x \in X\}$ and we see that each $f_i = (M_i + 1) \frac{1}{M_i + 1} f_i$, where $0 \leq \frac{1}{M_i + 1} f_i \leq 1$. Hence it suffices to establish this for $0 \leq f \leq 1$. Now let $K_0 = \text{supp } f$, for $j = 1, \dots, n$, let $K_j = f^{-1}\left(\left[\frac{j}{n}, 1\right]\right)$ so each K_0, \dots, K_n is compact and $K_0 \supseteq K_1 \supseteq \dots \supseteq K_n$. Then let $f_j = \min\left\{\max\left\{f - \frac{j-1}{n}, 0\right\}, \frac{1}{n}\right\}$.

Then $f = \sum_{j=1}^n f_j$ and $1_{K_j} \leq n f_j \leq 1_{K_{j-1}}$, $j = 1, \dots, n$. Hence, taking integrals, we see $\mu(K_j) \leq n \int_X f_j d\mu \leq \mu(K_{j-1})$, so that

$$\frac{1}{n} \sum_{j=1}^n \mu(K_j) \leq \int_X f d\mu \leq \frac{1}{n} \sum_{j=1}^n \mu(K_{j-1}) \quad (*)$$

On the other hand, we have $K_j < n f_j < K_{j-1}^\circ$, so using (II), $\mu(K_j) \leq n I(f_j) \leq \mu(K_{j-1}^\circ) \leq \mu(K_{j-1})$. Thus

$$\frac{1}{n} \sum_{j=1}^n \mu(K_j) \leq I(f) \leq \frac{1}{n} \mu(K_{j-1}) \quad (\dagger)$$

Hence, by (*) and (†), we obtain

$$|I(f) - \int_X f \mu| \leq \frac{1}{n} (\mu(K_0) - \mu(K_1)) \leq \frac{1}{n} \mu(K_0)$$

and this holds for any $n \in \mathbb{N}$, so $I(f) = \int_X f \mu$.

(V) Inner regularity on open sets. Let $U \subseteq X$ be open. Find $(f_n)_{n=1}^\infty \subseteq C_c(X)$, each $f_n < U$ so $\lim_{n \rightarrow \infty} I(f_n) = \mu^0(U) = \mu(U)$. Let $K_n = \text{supp } f_n \subseteq U$. Then, by (IV),

$$I(f_n) = \int f_n \mu \leq \int 1_{K_n} \mu = \mu(K_n) \leq \mu(U)$$

and hence, by squeeze, $\lim_{n \rightarrow \infty} \mu(K_n) = \mu(U)$, i.e. $\mu(U) \leq \sup\{\mu(K) : K \subseteq U, K \text{ compact}\}$ where “ \geq ” is obvious.

(VI) Uniqueness. Let μ' be a Radon measure for which $\int f \mu' = I(f)$ for $f \in C_c(X)$. Then, if U is open and $K < f < U$, then

$$\mu'(K) = \int 1_K \mu' \leq \int f \mu' = I(f) = \int f \mu \leq \int 1_U \mu = \mu(U)$$

so

$$\sup\{\mu'(K) : K \subseteq U, K \text{ compact}\} \leq \sup\{I(f) : f < U\} \leq \mu'(U)$$

but, by inner regularity of μ' on open sets and definition of $\mu(U) = \mu^0(U)$, we see $\mu'(U) \leq \mu(U) \leq \mu'(U)$. Thus $\mu' = \mu$ on open sets. Since each is outer regular, hence $\mu' = \mu$ on $\mathcal{B}(X)$.

13.2 Proposition. Let (X, d) be a locally compact measure space and $\mu : \mathcal{B}(X) \rightarrow [0, \infty]$ a Radon measure. Then for $1 \leq p < \infty$, we have that $C_c(X)/\sim_\mu$ is dense in $L^p(\mu)$.

PROOF Note that $C_c(X)/\sim_\mu \subseteq L^p(\mu)$ as μ is locally finite. If $E \in \mathcal{B}(X)$, $\mu(E) < \infty$, then by inner and outer regularity we can find for any $\epsilon > 0$ and $\mu(E) < \mu(K) + \epsilon/2$, and $\mu(U) < \mu(E) + \epsilon/2$. Thus $\mu(U \setminus K) = \mu(U \setminus E) + \mu(E \setminus K) < \infty$. Then for any $K < f < U$, we have

$$\|f - 1_E\|_\mu^p = \int |f - 1_E|^p \mu \leq \int |1_U - 1_K|^p \mu = \int 1_{U \setminus K} \mu < \epsilon$$

Thus simple elements of $L^p(\mu)$ are approximated from $C_c(X)/\sim_\mu$, and hence arbitrary elements. ■

13.3 Theorem. Let (X, d) be a σ -compact locally compact metric space. Then every locally finite measure $\nu : \mathcal{B}(X) \rightarrow [0, \infty]$ (i.e. $\nu(K) < \infty$, K compact) is a Radon measure. In particular, ν is outer regular and inner regular.

PROOF Since ν is locally finite, each $f \in C_c(X)$ is Borel measurable and $\|f\| \leq 1_{\text{supp } f}$, so $f \in L(\nu)$. Since ν is non-negative, $I(f) = \int_X f \nu$ defines a positive linear function on $C_c(X)$. Hence, the Riesz Representation Theorem provides us with a Radon measure μ such that $\int_X f \nu = \int_X f \mu$. Let's show that $\nu = \mu$.

(I) Let $U \subseteq X$ be open. Since X is σ -compact, write $X = \bigcup_{n=1}^{\infty} L_n$, each $L_n \subseteq X$ compact and $L_1 \subseteq L_2 \subseteq \dots$. For each n , let $F_n = \{x \in U : d(x, X \setminus U) \geq 1/n\}$ and let $K_n = L_n \cap F_n \subseteq U$. Since $F_1 \subseteq F_2 \subseteq \dots$, $K_1 \subseteq K_2 \subseteq \dots$. Furthermore, if $x \in U$, there is n_1 so that $d(x, X \setminus U) \geq \frac{1}{n_1}$, and n_2 such that $x \in L_{n_2}$. Thus for $n \geq \max\{n_1, n_2\}$, we have $x \in K_n \cap L_n$. Thus $U = \bigcup_{n=1}^{\infty} K_n$. Let's choose $(f_n)_{n=1}^{\infty} \subset C_c(X)$ inductively:

- $K_1 < f_1 < U$
- $K_2 \cup \text{supp } f_1 < f_2 < U$
- $K_{n+1} \cup \text{supp } f_n < f_{n+1} < U$

Thus $f_1 \leq f_2 \leq \dots$ and $\lim_{n \rightarrow \infty} f_n = 1_U$. Thus by MCT, we have

$$\nu(U) = \int 1_U \nu = \lim_{n \rightarrow \infty} \int f_n \nu = \lim_{n \rightarrow \infty} \int f_n \mu = \int 1_U \mu = \mu(U)$$

(II) Now let $E \in \mathcal{B}(X)$, $\mu(E) < \infty$. Given $\epsilon > 0$, find $K \subseteq E \subseteq V$, K compact, V open, so that $\mu(E) < \mu(K) + \epsilon/2$ and $\mu(V) < \mu(E) + \epsilon/2$. Hence by (I),

$$\nu(V) - \nu(K) = \nu(V \setminus K) = \mu(V \setminus K) < \epsilon$$

Thus

$$\nu(E) \leq \mu(V) < \nu(K) + \epsilon \leq \nu(E) + \epsilon$$

Thus $\nu(E) = \inf\{\nu(V) : E \subseteq V, V \text{ open}\} = \inf\{\mu(V) : E \subseteq V, V \text{ open}\} = \mu(E)$.

Finally, by (II) and continuity from below, we have

$$\mu(E) = \lim_{n \rightarrow \infty} \mu(E_n) = \lim_{n \rightarrow \infty} \nu(E_n) = \nu(E) \quad \blacksquare$$

13.4 Corollary. If (X, d) is a σ -compact locally compact metric space, and $\mu : \mathcal{B}(X) \rightarrow \mathbb{C}$, then μ is a linear combination of up to 4 finite Radon measures.

PROOF We consider, for example, the Jordan decomposition, $\mu = \mu_1 - \mu_2 + i[\mu_3 - \mu_4]$. Each μ_k is a finite measure, and hence Radon. \blacksquare

13.5 Corollary. The d -dimensional Lebesgue measure $\lambda_d : \mathcal{B}(\mathbb{R}^d) \rightarrow [0, \infty]$ is inner and outer regular.

PROOF We note that $\mathbb{R}^d = \bigcup_{n=1}^{\infty} \overline{B_n(0)}$ is σ -compact. If $K \subseteq \mathbb{R}^d = \bigcup_{n=1}^{\infty} (-n, n)^d$ is compact, then $K \subseteq (-n_0, n_0)^d$ for some n_0 . Hence $\lambda_d(K) \leq \lambda_d((-n_0, n_0)^d) = (2n_0)^d < \infty$. Thus λ_d is a locally finite measure on a σ -compact space, hence Radon. \blacksquare

Remark. If $\emptyset \neq U \subseteq \mathbb{R}^d$ is open, then $\lambda_d(U) > 0$. Indeed, if $x \in U$, find $\epsilon > 0$ such that $\prod_{j=1}^d (x_j - \epsilon, x_j + \epsilon) = B(x, d_{\infty}) \subseteq U$, and we have $\lambda_d(U) \geq (2\epsilon)^d > 0$.

TODO: dual of L1 is Linfty (for finite measures)

14 DIFFERENTIATION IN \mathbb{R}^d

If $f : (a, b) \rightarrow \mathbb{C}$ is continuous and bounded (with $\lim_{t \rightarrow \infty} f(t) = f(a)$), then for $x \in (a, b)$,

$$f(x) = \lim_{r \rightarrow 0^+} \frac{1}{2r} \int_{x-r}^{x+r} f(s) ds$$

We shall generalize this so integrable f and $d > 1$.

If $x \in \mathbb{R}^d$, $r > 0$, we let $B_r(x) = \{y \in \mathbb{R}^d : \|x - y\|_2 < r\}$. In fact, we could replace $\|\cdot\|_2$ with any norm on \mathbb{R}^d and the results will remain true as stated.

14.1 Lemma. (Covering) *Let \mathcal{C} be a collection of Euclidean balls in \mathbb{R}^d , $U = \bigcup_{B \in \mathcal{C}} B$. Then for any $0 < c < \lambda_d(U)$, there exist B_1, \dots, B_n in \mathcal{C} such that $B_i \cap B_j = \emptyset$ for $i \neq j$ and $3^d \sum_{i=1}^n \lambda_d(B_i)$.*

PROOF Since $U \neq \emptyset$, there is c as above. By inner regularity, there is $K \subseteq U$ compact such that $\lambda_d(K) > c$. Since $K \subseteq U = \bigcup_{B \in \mathcal{C}} B$, there is B'_1, \dots, B'_m in \mathcal{C} such that $K \subseteq \bigcup_{j=1}^m B'_j$. Write each $B'_j = B_{r'_j}(x'_j)$, we may relabel $r'_1 \geq \dots \geq r'_m$. Then

- $B_1 = B'_1$
- $B_2 = B'_{j_2}$ where $j_2 = \min\{j \in [m] : B'_j \cap B_1 = \emptyset\}$.
- $B_n = B'_{j_n}$ where $j_n = \min\{j \in \{j_{n+1} + 1, \dots, m\} : B'_j \cap \bigcup_{i=1}^{n-1} B_i\}$

where n is determined by where this process stops. If $B'_j \notin \{B_1, \dots, B_n\}$, then $B'_j \cap B_i = B'_{j_i}$ for some $j_i < j$, so $r_i := r'_{j_i} \geq r'_j$. If we write $B_i = B_{r_i}(x_i)$, then $B'_j \subseteq B_{3r_i}(x_i)$. Notice that

$$\lambda_d(B_{3r_i}(x_i)) = \lambda_d(3I(B_{r_i}(0)) + x_i) = 3^d \lambda_d(B_{r_i}(x_i))$$

Thus

$$\begin{aligned} c < \lambda_d(K) &\leq \lambda_d\left(\bigcup_{j=1}^n B'_j\right) \leq \lambda_d\left(\bigcup_{j=1}^n B_{3r_i}(x_i)\right) \\ &\leq \sum_{i=1}^n \lambda_d(B_{3r_i}(x_i)) = 3^d \sum_{i=1}^n \lambda_d(B_i) \end{aligned} \quad \blacksquare$$

Definition. If $f \in L(\lambda_d)$, we let $A_r f(x) = \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} f(y) dy$ denote the “average value”, for $r > 0$, $x \in \mathbb{R}^d$. We let the **Hardy-Littlewood maximal functions**

$$Hf(x) = \sup_{r>0} A_r |f|(x)$$

Remark. (i) $(r, x) \mapsto A_r f(x) : (0, \infty) \times \mathbb{R}^d \rightarrow \mathbb{R}$ is continuous. First, as above, $\lambda_d(B_r(x)) = \lambda_d(rI(B_1(0))) = r^d \lambda_d(B_1(0))$. Second, if $((r_n, x_n))_{n=1}^\infty$ with $\lim_{n \rightarrow \infty} (r_n, x_n) = (r, x)$, then $1_{B_{r_n}(x_n)} |f| \leq |f|$ and $\lim_{n \rightarrow \infty} 1_{B_{r_n}(x_n)} f = f$ pointwise. Hence by LDC,

$$A_{r_n} f(x) = \frac{1}{r_n^d \lambda_d(B_1(0))} \int 1_{B_{r_n}(x_n)} f \xrightarrow{n \rightarrow \infty} \frac{\int 1_{B_r(x)} f}{r^d \lambda_d(B_1(0))} = A_r f(x)$$

(ii) $Hf(x) = \sup_{r>0} A_r |f|(x) = \sup_{r \in (0, \infty) \cap \mathbb{Q}} A_r |f|(x)$ so Hf is the supremum of a countable family of continuous functions and hence Borel measurable.

(iii) We may define $A_r f$ and hence Hf for f in

$$L_{loc}(\lambda_d) = \{f \in M(\mathbb{R}^d, \mathcal{B}(\mathbb{R}^d)) : 1_K f \in L(\lambda_d) \text{ for any compact } K \subset \mathbb{R}^d\}$$

14.2 Theorem. (Hardy Littlewood Maximal) *If $f \in L(\lambda_d)$ and $\alpha > 0$, then*

$$\lambda_d(Hf^{-1}((\alpha, \infty))) \leq \frac{3^d}{\alpha} \int_{\mathbb{R}^d} |f| dx$$

PROOF Let $E_\alpha = Hf^{-1}((\alpha, \infty])$. Then for each $x \in E_\alpha$, $Hf(x) > \alpha$ so there is $r_x > 0$ such that $A_{r_x}|f|(x) > \alpha$. Now, $E_\alpha \subseteq \bigcup_{x \in E_\alpha} B_{r_x}(x) = U$, so if $0 < \lambda_d(E_\alpha)$ and $0 < c < \lambda_d(E_\alpha) \leq \lambda_d(U)$, the last lemma provides $x_1, \dots, x_n \in E_\alpha$ with $B_i = B_{r_{x_i}}(x_i)$ for $i = 1, \dots, n$ such that $B_i \cap B_j = \emptyset$ and $c < 3^d \sum_{i=1}^n \lambda_d(B_i)$. Then for each i ,

$$\frac{1}{\lambda_d(B_i)} \int_{B_i} |f| = A_{r_{x_i}}(x_i) > \alpha \quad \Rightarrow \quad \frac{1}{\alpha} \int_{B_i} |f| > \lambda_d(B_i)$$

and hence

$$c < 3^d \sum_{i=1}^n \lambda_d(B_i) < \frac{3^d}{\alpha} \sum_{i=1}^n \int_{B_i} |f| = \frac{3^d}{\alpha} \int_{\bigcup_{i=1}^n B_i} |f| \leq \frac{3^d}{\alpha} \int |f| \quad \blacksquare$$

14.3 Corollary. If $f \in \overline{M}^+(X, \mathcal{M})$ and $\mu : \mathcal{M} \rightarrow [0, \infty]$ is a measure, and $\alpha > 0$, then

$$\int_{f^{-1}((\alpha, \infty])} f \, \mu \geq \int_{f^{-1}((\alpha, \infty])} \alpha 1_{\mu} = \alpha \mu(f^{-1}((\alpha, \infty]))$$

so that

$$\frac{1}{\alpha} \int_{f^{-1}((\alpha, \infty])} f \, \mu \geq \mu(f^{-1}((\alpha, \infty]))$$

14.4 Theorem. (First Differentiation) If $f \in L_{loc}(\lambda_d)$, then $\lim_{r \rightarrow 0^+} A_r f(x) = f(x)$ for λ_d -a.e. in \mathbb{R}^d .

PROOF Since $\mathbb{R}^d = \bigcup_{N=1}^{\infty} B_N(0)$, it suffices to prove this result for $1_{B_N(x)}f$. Hence we may assume $f \in L(\lambda)$. Given $\epsilon > 0$, since λ_d is a Radon measure, there is $h \in C_c(\mathbb{R}^d)$ such that $\int |h - f| < \epsilon$. Notice that

$$\begin{aligned} |A_r h(x) - h(x)| &= \left| \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} (h(y) - h(x)) \, \lambda \right| \\ &= \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} |h(y) - h(x)| \, \lambda \\ &\leq \sup_{y \in B_r(x)} |h(y) - h(x)| \rightarrow 0 \end{aligned}$$

as $r \rightarrow 0^+$. Thus

$$\begin{aligned} \limsup_{r \rightarrow 0^+} |A_r f(x) - f(x)| &\leq \limsup_{r \rightarrow 0^+} [|A_r f(x) - A_r h(x)| + |A_r h(x)| + |A_r h(x) - h(x)| + |h(x) - f(x)|] \\ &\leq \lim_{r \rightarrow 0} \sup_{r' \in (0, r)} [A_{r'} |f - h|(x) + |h(x) - f(x)|] \\ &\leq H(f - h)(x) + |f(x) - h(x)| \end{aligned}$$

Given $\delta > 0$, let $E_\delta = \{x \in \mathbb{R}^d : \limsup_{r \rightarrow 0^+} |A_r f(x) - f(x)| > \delta\}$. Then

$$E_\delta \subseteq \left\{x \in \mathbb{R}^d : H(f - h)(x) > \frac{\delta}{2}\right\} \cup \left\{x \in \mathbb{R}^d : |f(x) - h(x)| > \frac{\delta}{2}\right\}$$

so by the Hardy-Littlewood maximal theorem and Chebeshev's inequality,

$$\begin{aligned}\lambda_d(E_\delta) &\leq \lambda_d(H(f-h)^{-1}((\delta/2, \infty])) + \lambda_d(|h-f|^{-1}((\delta/2, \infty])) \\ &\leq \frac{2 \cdot 3^d}{\delta} \int |f-h| + \frac{2}{\delta} \int_{|f-h|^{-1}((\delta/2, \infty))} |f-h| \\ &< \frac{2 \cdot 3^d + 2}{\delta} \epsilon\end{aligned}$$

Then, since $\epsilon > 0$ is arbitrary, $\lambda_d(E_\delta) = 0$. Then for $x \in \mathbb{R}^d \setminus \bigcup_{n=1}^\infty E_{1/n}$, we have $\lim_{r \rightarrow 0^+} |A_r f(x) - f(x)| = 0$. ■

14.5 Corollary. For $f \in L_{loc}(\lambda_d)$, we define its **Lebesgue set** to be

$$L_f = \left\{ x \in \mathbb{R}^d : \lim_{r \rightarrow 0^+} \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} |f(y) - f(x)| dy = 0 \right\}$$

Then $\lambda_d^*(\mathbb{R}^d \setminus L_f) = 0$, where λ_d^* is the outer measure associated to λ_d .

PROOF Let $\overline{\{c_n\}_{n=1}^\infty} = \mathbb{C}$. Let

$$E_n = \left\{ x \in \mathbb{R}^d : \limsup_{r \rightarrow 0^+} |A_r f - c_n| |f(x) - |f(x) - c_n|| > 0 \right\}$$

so E_n is a λ_d -null set, and $E = \bigcup_{n=1}^\infty E_n$ is also null. If $x \in \mathbb{R}^d \setminus E$ and $\epsilon > 0$, then $|f(x) - c_n| < \epsilon$ for some n . Thus for any $y \in \mathbb{R}^d$,

$$|f(y) - f(x)| \leq |f(y) - c_n| + |c_n - f(x)| < |f(y) - c_n| + \epsilon$$

Thus, as $x \notin E_n$,

$$\begin{aligned}\frac{1}{\lambda_r(B_r(x))} \int_{B_r(x)} |f(y) - f(x)| dy &\leq \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} (|f(y) - c_n| + \epsilon) dy \\ &= \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} |f(y) - c_n| dy + \epsilon \\ &\xrightarrow{r \rightarrow 0^+} |f(x) - c_n| + \epsilon < 2\epsilon\end{aligned}$$

Thus as $\epsilon > 0$ is arbitrary, the limit

$$\lim_{r \rightarrow 0^+} \frac{1}{\lambda_d(B_r(x))} \int_{B_r(x)} |f(y) - f(x)| dy = 0$$

for $x \in E$. We have $\mathbb{R}^d \setminus E \subseteq L_f$, so $\mathbb{R}^d \setminus L_f \subseteq E$. ■

14.6 Theorem. Let $\mu : \mathcal{B}(\mathbb{R}^d) \rightarrow [0, \infty]$ be a locally finite measure such that $\mu \perp \lambda_d$. Then

$$\lim_{r \rightarrow 0^+} \frac{\mu(B_r(x))}{\lambda_d(B_r(x))} = 0$$

for λ_d -a.e. x .

PROOF Let (E, F) be a Borel partition of \mathbb{R}^d such that $\mu(F) = 0 = \lambda_d(E)$. For $\delta > 0$, let

$$F_\delta = \left\{ x \in F : \limsup_{r \rightarrow 0^+} \frac{\mu(B_r(x))}{\lambda_d(B_r(x))} > \delta \right\}$$

Since μ is a Radon measure, given $\epsilon > 0$, there is open $U \supseteq F$ such that $\mu(U) < \epsilon$. If $x \in F_\delta \subseteq U$, there is $r_x > 0$ be so that

$$B_x := B_{r_x}(x) \subseteq U \text{ and } \frac{\mu(B_x)}{\lambda_d(B_x)} \geq \delta$$

Then $F_\delta \subseteq \bigcup_{x \in F_\delta} B_x := V \subseteq U$ and given $0 < f < \lambda_d(V)$, we may find $B_{x_1}, \dots, B_{x_n}, x_1, \dots, x_n \in F_\delta$ such that

$$B_{x_i} \cap B_{x_j} = \emptyset \text{ and } c < 3^d \sum_{i=1}^n \lambda_d(B_{x_i})$$

Thus,

$$\begin{aligned} c &< e^d \sum_{i=1}^n \lambda_d(B_{x_i}) \leq \frac{3^d}{\delta} \sum_{i=1}^n \mu(B_{x_i}) = \frac{3^d}{\delta} \sum_{i=1}^n \mu\left(\bigcup_{i=1}^n B_{x_i}\right) \\ &\leq \frac{3^d}{\delta} \mu(V) \leq \frac{3^d}{\delta} \mu(U) < \frac{3^d}{\delta} \epsilon \end{aligned}$$

But then we have

$$\lambda_d^*(F_\delta) \leq \lambda_d(V) = \lim_{c \rightarrow \lambda_d(V)^-} c \leq \frac{3^d}{\delta} \epsilon$$

since $\epsilon > 0$ is arbitrary, we see that $\lambda_d^*(F_\delta) = 0$. Hence, if $x \in \mathbb{R}^d \setminus \bigcup_{k=1}^\infty F_{1/k}$, then

$$\lim_{r \rightarrow 0^+} \frac{\mu(B_r(x))}{\lambda_d(B_r(x))} = 0 \quad \blacksquare$$

Definition. A collection of sets $\{E_r(x) : x \in \mathbb{R}^d, r > 0\} \subseteq \mathcal{B}(\mathbb{R}^d)$ is called **nicely shrinking** if for each $x \in \mathbb{R}^d$, $r > 0$,

- $E_r(x) \subseteq B_r(x)$
- $\lambda_d(E_r(x)) > \alpha \lambda_d(B_r(x))$, where α is a fixed constant.

14.7 Corollary. Let $\nu : \mathcal{B}(\mathbb{R}^d) \rightarrow \mathbb{C}$ be a complex measure with Lebesgue-Radon-Nikodym decomposition

$$\nu = \rho + f \cdot \lambda_d, \rho \perp \lambda_d, f \in L(\lambda_d)$$

Then for any nicely shrinking family $\{E_r(x) : x \in \mathbb{R}^d, r > 0\}$, we have

$$\lim_{r \rightarrow 0^+} \frac{\nu(E_r(x))}{\lambda_d(E_r(x))} = f(x)$$

for λ_d -a.e. x in \mathbb{R}^d .

PROOF Write $\rho = \operatorname{Re} \rho^+ - \operatorname{Re} \rho^- + i[\operatorname{Im} \rho^+ - \operatorname{Im} \rho^-]$, $\operatorname{Re} \rho^+, \dots, \operatorname{Im} \rho^- \leq |\rho| \leq \operatorname{Re} \rho^+ + \dots + \operatorname{Im} \rho^-$. Thus each $\operatorname{Re} \rho^+, \dots, \operatorname{Im} \rho^- \perp \lambda_d$. By Differentiation Theorem II, we see that

$$\lim_{r \rightarrow 0^+} \frac{\mu(E_r(x))}{\lambda_d(E_r(x))} \leq \lim_{r \rightarrow 0^+} \frac{\mu(B_r(x))}{\alpha \lambda_d(B_r(x))} = 0$$

λ_d -a.e. Hence we conclude the same for ρ . On the other hand,

$$\left| \frac{1}{\lambda_d(E_r(x))} \int_{E_r(x)} f(x) \bar{y} - f(x) \right| \leq \frac{1}{\lambda_d(E_r(x))} \int_{E_r(x)} |f(y) - f(x)| \bar{y} \leq \frac{1}{\alpha \lambda_d(B_r(x))} \int_{B_r(x)} |f(y) - f(x)| \bar{y} \xrightarrow{r \rightarrow 0^+} 0$$

provided that $x \in L_f$. ■

14.8 Proposition. If $F \in \operatorname{ND}_r(\mathbb{R})$, then $F'(x)$ exists for λ -a.e. x in \mathbb{R} .

PROOF If $h \neq 0$, then

$$\frac{F(x+h) - F(x)}{h} = \begin{cases} \frac{\mu_F((x, x+h])}{\lambda_d((x, x+h])} & : h > 0 \\ \frac{\mu_F((x+h, x])}{\lambda_d((x+h, x])} & : h < 0 \end{cases}$$

Since each family $\{(x, x+h] : x \in \mathbb{R}, h > 0\}$ and $\{(x-h, x] : x \in \mathbb{R}, h > 0\}$ is nicely shrinking, we see that

$$\lim_{h \rightarrow 0^+} \frac{F(x+h) - F(x)}{h}, \lim_{h \rightarrow 0^-} \frac{F(x+h) - F(x)}{h}$$

converge for λ -a.e. x , s right and left limits both exist for such x . However, each is λ -a.e. equal to $\frac{\mu_F}{\lambda}$, thanks to the last corollary. Hence F' exists λ -a.e. ■

Example. Consider the Cantor ternary function $\phi \in \operatorname{ND}_r(\mathbb{R})$. It is easy to see that $\phi'(x) = 0$ whenever $x \in \mathbb{R} \setminus C$.

Definition. Let $F : \mathbb{R} \rightarrow \mathbb{C}$. If $a < b$ in \mathbb{R} , we define the **variation** of F on $[a, b]$ by

$$V_F[a, b] = \sup \left\{ \sum_{i=1}^n |F(a_i) - F(a_{i-1})| : a = a_0 < a_1 < \dots < a_n = b, n \in \mathbb{N} \right\}$$

Example. Consider $F(x) = x \sin(1/x)$ for $x > 0$, and 0 when $x = 0$. Then $V_F[0, \epsilon] = \infty$ for $\epsilon > 0$.

14.9 Proposition. (i) If $a < b < c$, then $V_F[a, c] = V_F[a, b] + V_F[b, c]$.

(ii) If $a' \leq a \leq b \leq b'$, then $V_F[a, b] \leq V_F[a', b']$

Definition. Define $V_F(a, b] = \lim_{x \rightarrow a} V_F[x, b]$ and $V_F(-\infty, b] = \lim_{x \rightarrow -\infty} V_F[x, b]$.

14.10 Proposition. (i) If F is right continuous at a and $V_F[a, b] < \infty$, then $V_F(a, b] = V_F[a, b]$.

(ii) If $V_F(-\infty, b] < \infty$, then $\lim_{x \rightarrow -\infty} V_F(-\infty, x] = 0$.

PROOF (i) Certainly $V_F(a, b] \leq V_F[a, b]$. To see the converse inequality, given $\epsilon > 0$, let $\delta > 0$ be such that $a < x < a + \delta$ so $|F(x) - F(a)| < \epsilon$. Now we let $a < a_0 < \dots < a_n = b$ be so

- $\sum_{i=1}^n |F(a_i) - F(a_{i-1})| > V_F[a, b] - \epsilon$
- $a < a + 1 < a + \delta$

Then

$$\begin{aligned} V_F[a, b] &< |F(a_1) - F(a_0)| + \sum_{i=2}^n |F(a_i) - F(a_{i-1})| + \epsilon \\ &< \epsilon + V_F[a_1, b] + \epsilon \leq V_F(a, b) + 2\epsilon \end{aligned}$$

Since $\epsilon > 0$ is arbitrary, $V_F[a, b] \leq V_F(a, b)$.

(ii) For fixed $x < b$, then by (A)

$$\begin{aligned} V_F(-\infty, b] &= \lim_{y \rightarrow -\infty} V_F[y, b] \\ &= \lim_{y \rightarrow -\infty, y < x} (V_F[y, x] + V_F[x, b]) \\ &= V_F(-\infty, x] + V_F[x, b] \end{aligned}$$

Then take $x \rightarrow -\infty$.

Definition. If $V_F(-\infty, x] < \infty$ for each $x \in \mathbb{R}$, we define the **total variation** function of F by $T_F(x) = V_F(-\infty, x] \in [0, \infty)$. If $\sup_{x \in \mathbb{R}} T_F(x) < \infty$, we say that F is of **bounded variation**. Write $F \in BV(\mathbb{R})$. We further let

$$BV_r(\mathbb{R}) = \{F \in BV(\mathbb{R}) : F \text{ is right continuous}\}$$

Remark. (i) It follows (ii) that $T_F(-\infty) = \lim_{x \rightarrow -\infty} T_F(x) = 0$.

(ii) If $F \in BV_r(\mathbb{R})$, then T_F is right continuous. Let $a < x < b$, and we use (*), (A), and part (i) of the last proposition to see that

$$\begin{aligned} T_F(x) - T_F(a) &= V_F[a, x] = V_F[a, b] - V_F[x, b] \\ &= V_F(a, b) - V_F[x, b] \rightarrow 0 \end{aligned}$$

so $\lim_{x \rightarrow a^+} T_F(x) = T_F(a)$.

14.11 Proposition. (i) $F \in BV(\mathbb{R})$ if and only if $\operatorname{Re} F, \operatorname{Im} F \in BV(\mathbb{R})$

(ii) If $G \in BV^{\mathbb{R}}(\mathbb{R})$, then each of $T_F \pm F$ is non-decreasing.

(iii) If $F \in BV(\mathbb{R})$, we let

$$\begin{aligned} F_1 &= \frac{1}{2}(T_{\operatorname{Re} F} + \operatorname{Re} F), & F_2 &= \frac{1}{2}(T_{\operatorname{Re} F} - \operatorname{Re} F) \\ F_3 &= \frac{1}{2}(T_{\operatorname{Im} F} + \operatorname{Im} F), & F_4 &= \frac{1}{2}(T_{\operatorname{Im} F} - \operatorname{Im} F) \end{aligned}$$

Then $F = F_1 - F_2 + i[F_3 - F_4]$. Thus, F is bounded and $F(\pm\infty) = \lim_{x \rightarrow \pm\infty} F(x)$ exists.

PROOF (i) If $x < y$ in \mathbb{R} , then by using definitions of V_H , $H = F, \operatorname{Re} F, \operatorname{Im} F$, we see

$$V_{\operatorname{Re} F}[x, y], V_{\operatorname{Im} F}[x, y] \leq V_F[x, y] \leq V_{\operatorname{Re} F}[x, y] + V_{\operatorname{Im} F}[x, y]$$

Taking $x \rightarrow -\infty$, we see that

$$T_{\operatorname{Re} F}(x), T_{\operatorname{Im} F}(y) \leq T_F(y) \leq T_{\operatorname{Re} F}(y) + T_{\operatorname{Im} F}(y)$$

and then taking $y \rightarrow \infty$ does the job.

(ii) If $x < y \in \mathbb{R}$, then

$$\begin{aligned} (T_G \pm G)(y) - (T_G \pm G)(x) &= T_G(y) - T_G(x) \pm [G(y) - G(x)] \\ &= V_G[x, y] + [G(y) - G(x)] \geq |G(y) - F(x)| \pm [G(y) - F(x)] \geq 0 \end{aligned}$$

Furthermore, $T_G(\pm\infty)$ always exists...

(iii) Obvious ■

Remark. If F above is right continuous, so too are $\operatorname{Re} F$, $\operatorname{Im} F$, and hence F_1, F_2, F_3, F_4 . If $F : \mathbb{R} \rightarrow \mathbb{R}$ is bounded, then $F \in \operatorname{BV}^{\mathbb{R}}(\mathbb{R})$.

14.12 Theorem. (Complex Borel Measures on \mathbb{R}) Let $F \in \operatorname{BV}_r(\mathbb{R})$.

(i) There is a complex measure $\mu_F : \mathcal{B}(\mathbb{R}) \rightarrow \mathbb{C}$ such that

$$\mu_F((a, b]) = F(b) - F(a) \text{ for } a < b \text{ in } \mathbb{R} \quad (\dagger)$$

(ii) If $G \in \operatorname{BV}_r^{\mathbb{R}}(\mathbb{R})$ (real-valued), then |

(iii) **PROOF** (i) Let $F = F_1 - F_2 + i[F_3 - F_4]$. Then each $F_K \in \operatorname{ND}_r(\mathbb{R})$ and corresponds to a measure μ_{F_K} satisfying the analogue of (\dagger) . Let $\mu_K = \mu_{F_1} - \mu_{F_2} + i[\mu_{F_3} - \mu_{F_4}]$.

(ii) Let $a < b$ in \mathbb{R} . we recall that

- $|\mu_G|((a, b]) = \sup \left\{ \sum_{i=1}^n |\mu_G(E_i)| : \{E_1, \dots, E_n\} \text{ is a Borel partition of } (a, b], n \in \mathbb{N} \right\}$
- $\mu_{T_G}((a, b]) = T_G(b) - T_G(a) = V_G[a, b] = \sup \left\{ \sum_{i=1}^n |G(a_i) - G(a_{i-1})| : (a, b] = \bigcup_{i=1}^n (a_{i-1}, a_i], n \in \mathbb{N} \right\}$

Hence, it is immediate that $\mu_{T_G}((a, b]) \leq |\mu_G|((a, b])$.

Now, $|\mu_G((a, b])| = |G(b) - G(a)| \leq V_G[a, b] = T_G(b) - T_G(a) = \mu_{T_G}((a, b])$. We let $\mathcal{H} = \{(c, d] : a \leq c < d \leq b\}$ and for any $A \in \langle \mathcal{H} \rangle \subseteq \mathcal{P}((a, b])$, we have $A = \bigcup_{i=1}^n (c_i, d_i]$ and hence we have

$$\begin{aligned} |\mu_G(A)| &= \left| \sum_{i=1}^n \mu_G((c_i, d_i]) \right| \leq \sum_{i=1}^n |\mu_G((c_i, d_i])| \\ &\leq \sum_{i=1}^n \mu_{T_G}((c_i, d_i]) = \mu_{T_G}(A) \end{aligned}$$

We let $\mathcal{C} = \{E \in \mathcal{B}((a, b]) : |\mu_G(E)| \leq \mu_{T_G}(E)\}$. Then

- $\langle \mathcal{H} \rangle \subseteq \mathcal{C}$
- If $E_1 \supseteq E_2 \supseteq \dots$ in \mathcal{C} , then by continuity from above,

$$\left| \mu_G \left(\bigcap_{n=1}^{\infty} E_n \right) \right| = \lim_{n \rightarrow \infty} |\mu_G(E_n)| \leq \lim_{n \rightarrow \infty} \mu_{T_G}(E_n) = \mu_{T_G} \left(\bigcap_{n=1}^{\infty} E_n \right)$$

- If $E_1 \subseteq E_2 \subseteq \dots$ in \mathcal{C} , then by continuity from below,

$$\left| \mu_G \left(\bigcup_{n=1}^{\infty} E_n \right) \right| \leq \mu_{T_G} \left(\bigcup_{n=1}^{\infty} E_n \right)$$

Thus by the Monotone Class Lemma, $\mathcal{C} \supseteq \sigma\langle\mathcal{H}\rangle = \mathcal{B}((a, b])$, so $\mathcal{C} = \mathcal{B}((a, b])$. Thus, for any Borel partition $\{E_1, \dots, E_n\}$ of $(a, b]$, we have

$$\sum_{i=1}^n |\mu_G(E_i)| \leq \sum_{i=1}^n \mu_{T_G}(E_i) = \mu_{T_G}\left(\bigcup_{i=1}^n E_i\right) = \mu_{T_G}((a, b])$$

Thus, $|\mu_G|((a, b]) \leq \mu_{T_G}((a, b])$. In conclusion, $|\mu_G|((a, b]) = \mu_{T_G}((a, b])$ and hence, by characterization of (locally) finite Borel measures on \mathbb{R} , $|\mu_G| = \mu_{T_G}$.

We have

$$\mu_G^\pm = \frac{1}{2}(|\mu_G| \pm \mu_G) = \frac{1}{2}(\mu_{T_G} \pm \mu_G) = \mu_{\frac{1}{2}(T_G \pm G)}$$

(iii) If ν satisfies $(\dagger\dagger)$, then we see for $a < b$ in \mathbb{R} that

$$\operatorname{Re} \nu((a, b]) = \operatorname{Re} F(b) - \operatorname{Re} F(a) = \mu_{\operatorname{Re} F}((a, b])$$

By (i), $\operatorname{Re} \nu$, $\mu_{\operatorname{Re} F}$ admit the same Jordan decomposition at least on intervals of the form $(a, b]$. Hence, by uniqueness for measures, $\operatorname{Re} \nu = \mu_{\operatorname{Re} F}$. Likewise, $\operatorname{Im} \nu = \mu_{\operatorname{Im} F}$.

■

Definition. If $F : \mathbb{R} \rightarrow \mathbb{C}$ is **absolutely continuous**, write $F \in (\mathbb{R})$, provided: given $\epsilon > 0$, there is $\delta > 0$ such that $a_1 \leq b_1 \leq a_2 \leq b_2 \leq \dots \leq a_n \leq b_n$ such that $\sum_{i=1}^n (b_i - a_i) < \delta$, we have $\sum_{i=1}^n |F(b_i) - F(a_i)| < \epsilon$.

Note that Lipschitz \Rightarrow Absolutely continuous \Rightarrow uniformly continuous \Rightarrow continuous.

14.13 Proposition. If $F \in \operatorname{BV}(\mathbb{R}) \cap (\mathbb{R})$, then $T_F \in (\mathbb{R})$.

PROOF Given $\epsilon > 0$, find $\delta > 0$ as in absolute continuity, with $a_i < b_i$. Then as $F \in \operatorname{BV}(\mathbb{R})$, for each $i = 1, \dots, n$, we find $a_i = t_{i,0} < \dots < t_{i,m_i} = b_i$ be so

$$\sum_{j=1}^{m_i} |F(t_{i,j}) - F(t_{i,j-1})| > V_F[a_i, b_i] - \epsilon/2^i$$

Then

$$\sum_{i=1}^n |T_F(b_i) - T_F(a_i)| = \sum_{i=1}^n V_F[a_i, b_i] < \sum_{i=1}^n \left(\sum_{j=1}^{m_i} |F(t_{i,j}) - F(t_{i,j-1})| + \frac{\epsilon}{2^i} \right) < 2\epsilon$$

since $\sum_{i=1}^n \sum_{j=1}^{m_i} (t_{i,j} - t_{i,j-1}) = \sum_{i=1}^n (b_i - a_i) < \delta$. ■

14.14 Theorem. (Fundamental Theorem of Calculus) (i) If $F \in \operatorname{BV}(\mathbb{R}) \cap (\mathbb{R}) \subseteq \operatorname{BV}_r(\mathbb{R})$, then $\mu_F \ll \lambda$.

(ii) If $f \in L(\lambda)$, then $F(x) = \int_{-\infty}^x f(t) \lambda(t)$ satisfies $F \in \operatorname{BV}(\mathbb{R}) \cap (\mathbb{R})$.

PROOF (i) By Jordan decomposition of F , it suffices to show this for $F \in (\mathbb{R}) \cap \operatorname{ND}(\mathbb{R})$.

Let $E \in \mathcal{B}(\mathbb{R})$ be so $\lambda(E) > 0$. Given $\epsilon > 0$, let $\delta > 0$ be as in the definition of absolute continuity. Let $\{(a_i, b_i]\}_{i=1}^\infty$ be so $E \subset \bigcup_{i=1}^\infty (a_i, b_i]$ and $\sum_{i=1}^\infty (b_i - a_i) = \sum_{i=1}^\infty \lambda((a_i, b_i]) < \delta$.

Find a sequence $\{(a'_i, b'_i]\}_{i=1}^\infty$ be such that there are $m_1 < m_2 < \dots$ such that

$$\bigcup_{i=1}^n (a_i, b_i] = \bigcup_{i=1}^{m_n} (a'_i, b'_i], \quad (a'_i, b'_i] \cap (a'_j, b'_j] = \emptyset \text{ if } i \neq j$$

Then for each n , $\sum_{i=1}^{m_n} (b'_i - a'_i) \leq \sum_{i=1}^n (b_i - a_i) < \delta$ so

$$\begin{aligned} \mu_F(E) &\leq \mu_F\left(\bigcup_{i=1}^{\infty} (a_i, b_i]\right) = \lim_{n \rightarrow \infty} \mu_F\left(\bigcup_{i=1}^n (a_i, b_i]\right) \\ &= \lim_{n \rightarrow \infty} \mu_F\left(\bigcup_{i=1}^{m_n} (a'_i, b'_i]\right) \\ &= \lim_{n \rightarrow \infty} \sum_{i=1}^n [F(b'_i) - F(a'_i)] \leq \epsilon \end{aligned}$$

as $\epsilon > 0$, we conclude that $\mu_F(E) = 0$.

(ii) Write $f = \operatorname{Re} f^+ - \operatorname{Re} f^- + i[\operatorname{Im} f^+ - \operatorname{Im} f^-]$ so

$$F(x) = f \cdot \mu((-\infty, x]) = \operatorname{Re} f^+ \cdot \mu((-\infty, x]) - \dots + i \operatorname{Im} f^+ \cdot \mu((-\infty, x])$$

is a linear combination of 4 non-decreasing bounded functions. Thus $F \in \operatorname{BV}(\mathbb{R})$.

We recall a proposition proven prior; since $|f| \cdot \lambda \ll \lambda$, the alternate characterization of absolute continuity applies. Hence if $a \leq b_1 \leq a_2 \leq b_2 \leq \dots \leq a_n \leq b_n$ in \mathbb{R} with

$$\lambda\left(\bigcup_{i=1}^n (a_i, b_i]\right) = \sum_{i=1}^n (b_i - a_i) < \delta$$

then

$$\begin{aligned} \sum_{i=1}^n |F(b_i) - F(a_i)| &= \sum_{i=1}^n \left| \int_{(a_i, b_i]} f \cdot \lambda \right| \\ &\leq \sum_{i=1}^n \int_{(a_i, b_i]} |f| \cdot \lambda = |f| \cdot \lambda \left(\bigcup_{i=1}^n (a_i, b_i] \right) < \epsilon \end{aligned}$$

Hence, $F \in \operatorname{BV}(\mathbb{R})$. ■

Remark. $F \in \operatorname{BV}(\mathbb{R}) \cap (\mathbb{R})$ if and only if there is $f \in L(\lambda)$ such that $F' = f$ λ -a.e., and $F(x) = \int_{-\infty}^x f \cdot \lambda$. Indeed, we saw earlier that $F \in \operatorname{BV}_r(\mathbb{R})$ is λ -a.e. differentiable. Since $F \in \operatorname{BV}(\mathbb{R}) \cap (\mathbb{R})$, $\mu_F \ll \lambda$ implies $\mu_F = f \cdot \lambda$ and hence $F' = f$ λ -a.e. by Differentiation Theorem 1. Converse is just given.
